### **BeyondInsight User Guide**

BeyondInsight is a central management, policy, reporting, and analytics console for many products within the BeyondInsight portfolio. BeyondInsight enables IT and security professionals to collaboratively reduce user-based risks, mitigate threats to information assets, address security exposures across large, diverse IT environments, and comply with internal, industry, and government mandates.

This guide provides instructions and procedures for using BeyondInsight.

### Components

#### **Discovery Scanner**

The Discovery Scanner is the scan engine responsible for scanning the assets in your environment. The Discovery Scanner agent receives instructions from the Central Policy service.

A security certificate is required by the Events Client to communicate with the agent. This certificate is created during the BeyondInsight installation.

#### **Manager Service**

This component is the BeyondInsight web interface.

The Manager Service also acts as a background service that gathers information from the Events Client, which retrieves information from the agents. The events are then encrypted and sent to the database.

#### **Application Bus (AppBus)**

The AppBus provides communications between BeyondTrust components and receives events to insert in the BeyondInsight database. This function can also be performed by a dedicated Event Server for scalability.

#### **Events Client**

The Events Client is responsible for forwarding information gathered by the Discovery Scanner agent.

The Events Client sends the information to the Manager Service. The Events Client is installed when a Discovery Scanner agent is installed.

#### **Events Client Certificate**

Generate security certificates to ensure secure transmission of data between clients and BeyondInsight. Use the BeyondInsight Configuration Tool to export certificates.

For more information, please see the <u>BeyondInsight Installation Guide</u> at <u>https://www.beyondtrust.com/docs/beyondinsight-</u> password-safe/bi/install/configuration-tool.htm.

#### **Central Policy Server**

Central Policy is a service that sends Discovery Scanner agents their settings. Central Policy is the component responsible for sending the agents job information.

For example, the Discovery Scanner agent needs to know the scan targets. This information is selected in the BeyondInsight management console. When the scan starts, the Central Policy sends the job information to the agent.

#### **Scheduling Service**

Responsible for contacting the update server and downloading the latest product updates.

### Log In to the BeyondInsight Console

The admin username used to sign into the BeyondInsight console for the first time is configured during the installation process. Afterward, the credentials you use to log in to the console depend on the type of authentication configured for your BeyondInsight system. Logging into the console varies depending on the type of authentication configured for your system.

The following authentication types can be used:

- **BeyondInsight:** Create local users in BeyondInsight and add them to groups to assign permissions to features. Local users can log in to the console from the BeyondInsight login page.
- Active Directory: Add Active Directory users in BeyondInsight and add them to groups to assign permissions to features. Active
  Directory users can log in to the console from the BeyondInsight login page.
- Azure Active Directory: Add Azure Active Directory users in BeyondInsight and add them to groups to assign permissions to features. Azure Active Directory users can log in to the console from the BeyondInsight login page.
- LDAP: Add LDAP users and add them to groups to assign permissions to features. LDAP users can log in to the console from the BeyondInsight login page.
- **Two-Factor Authentication:** Configure two-factor authentication with a RADIUS server or time-based one-time password (TOTP) authenticator app, and assign it to users in BeyondInsight. Users are prompted for their two-factor login options after providing their credentials on the BeyondInsight login page.
- Smart Card: Configure BeyondInsight to allow authentication using a smart card PIN. Users can bypass the BeyondInsight login page and navigate to the smart card site access URL provided by the administrator to use smart card authentication.
- SAML Authentication: Configure SAML identity providers in BeyondInsight to use authentication for web tools that support SAML 2.0 standard, such as PingID, Okta, and ADFS. Users can navigate to the SAML site access URL provided by your administrator to use SAML authentication.
- Claims-Aware: Configure a claims-aware website to bypass the current BeyondInsight login page and authenticate against any configured Federated Service that uses SAML to issue claims.

**Note:** When working in the console, the times displayed match the web browser on the local computer unless stated otherwise.

To log in:

1. Open a browser and enter the URL for your BeyondInsight / Password Safe instance: https://<hostname>/WebConsole/index.html.

Note: You might need to accept a pre-login message, if one has been configured on your system.

- 2. Enter your username and password. The default username is **Administrator**, and the password is the administrator password you set in the Configuration Wizard.
- 3. If applicable, select a domain or LDAP Server from the Log in to list.

\*

**Tip:** The Log in to list is only displayed on the Login page when there are either Active Directory or LDAP user groups created in the BeyondInsight console. The Log in to list is displayed by default, but may be disabled / enabled by an admin user by toggling the Show list of domains/LDAP servers on login page setting from Configuration > System > Site Options page.

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

4. Click Log In.

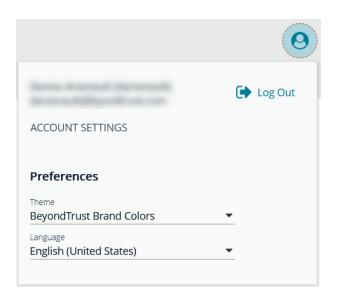

**Note:** If the initial login attempt fails, and two-factor authentication (2FA) is enabled, the user is taken to the 2FA page for security reasons.

For more information, please see the <u>BeyondInsight and Password Safe Authentication Guide</u> at https://www.beyondtrust.com/docs/beyondinsight-password-safe/bi/authentication/index.htm.

#### Log Out of the Console

To log out of the console, click **Profile and preferences** in the top-right corner, and then click **Log Out.** 

#### Select a Display Language

BeyondInsight and Password Safe can be displayed in the following languages:

- Dutch
- English
- French
- Japanese
- Korean
- Portuguese
- Spanish

If the Show language picker option is enabled in Configuration > System > Site Options > Localization, you can select a language from the list on the Log In page or by clicking the Profile and preferences button, and then selecting it from the Language list.

#### Navigate the Console

Once logged into the BeyondInsight Console, you are taken to the **Home** page, where the BeyondInsight suite of features is easily accessible by clicking the container cards or by clicking **Menu** in the left navigation menu.

Available features include:

- Assets: Display and manage all assets. Access the Smart Rules page to create and manage Smart Groups. Add assets to Password Safe management.
- Smart Rules: View and mange Smart Rules.
- **Discovery:** Run and schedule discovery scans, review active, completed, and scheduled scans, and view the list of discovery scanners.
- Endpoint Privilege Management: View and manage Endpoint Privilege Management events, policies, policy users, agents, file integrity monitoring, and session monitoring.
- Managed Systems: View and configure properties for Password Safe managed systems, managed databases, managed directories, managed applications, and their associated Smart Rules.
- Managed Accounts: View and configure properties for Password Safe managed accounts and their associated Smart Rules.
- Password Safe: Access the Password Safe web portal to request passwords and remote access sessions and to approve requests.
- Team Passwords: View and manage team credentials.
- Analytics & Reporting: Access reports on collected data.
- **Configuration:** Configure BeyondInsight and Password Safe components and objects, such as users and groups, authentication settings, connectors, and much more.
- About: Access helpful links and support tools, such as generating a support package and analysis to send to BeyondTrust Technical Support. View the current BeyondInsight version information, as well as the history of installed versions. View version information for currently installed plugins. View the maintenance expiry date and disable or enable the Maintenance Expiry Warning Banner.

**Note:** A warning banner displays at the top of the screen if your maintenance contract for BeyondInsight is close to expiry or has expired. Click **More Details** to go to the **About** page, where you can disable and re-enable the warning.

A warning banner displays at the top of the screen if your installation includes any Discovery Agents earlier than version 20.1. These must be updated by the end of 2021. You can go to **Discovery > Discovery Scanners** to view all scanners in the system, and their version.

Click Dismiss to hide warning banners until your next login.

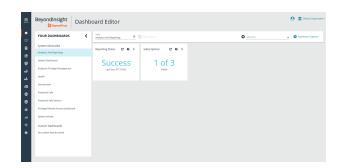

#### **Dynamic Dashboards**

Note: Only admin access is supported at this time, and more features will be added in later releases.

Dynamic Dashboards provide a faster, customizable experience, allowing administrators quick access to the information that is most important to them.

To access **Your Dashboards**, click **Menu > Dashboard (Preview)**. A list of available dashboards displays on the left. BeyondInsight comes with several prebuilt dashboard cards, including:

- Analytics & Reporting
- Default Dashboard
- Endpoint Privilege Management
- Health
- Omniworker
- Password Safe
- Password Safe Session
- Privileged Remote Access Dashboard
- System Activity

**Note:** The list of system-generated dashboards displayed can change depending on licensing, as well as data available in the system, and configuration settings. This also affects what tiles are shown in the **Add a tile** dropdown list.

Each dashboard card comes with preset tiles, which display information for that particular feature. Icons allow you to control the tile:

Click to refresh information displayed.

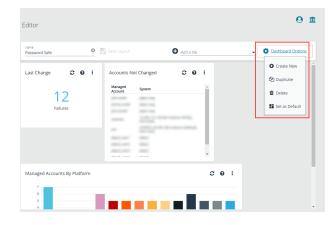

- Click to get information on what is displayed on the tile.
- Click to delete the tile. You can always add the tile later if needed.

	BeyondInsight Dashb	oard Editor	😧 🏛 Default Organization
•	YOUR DASHBOARDS	Ferrerend Safe	🖉 Add a tile 🔹 🌞 Dashboard Options

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

Use Dashboard Options to:

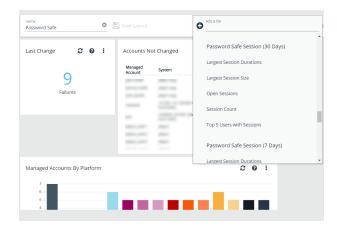

- **Create New:** Create a new empty dashboard, then add the tiles you want.
- Duplicate: Create a copy of the dashboard that can be modified.
- Delete: Delete the selected dashboard.
- Set as Default: Set the current dashboard as the default so it displays every time you click Menu > Dashboards.

#### **Customize a Dashboard**

You can customize a dashboard to display the information that is important to you. Tiles can be deleted, added, moved, and resized to allow you a personalized and more efficient experience.

- To create a custom dashboard, select one of the available dashboard cards. In this example we use the **Password Safe** card. If necessary, delete any of the existing tiles that come installed with that card.
- 2. From the **Add a tile** dropdown, select the tiles you want to add. Resize and reposition tiles in a manner that makes sense to you.
- 3. Next, under Name, give the layout a name so you can identify it.
- Click Save Layout. Your custom layout now appears on the lower left side of the window, under Custom Dashboards.
- If you want to make this your default layout so it opens every time you select Menu > Dashboard, click Dashboard Options, and then select Set as Default.

**Note:** Setting a dashboard as default causes that dashboard to be displayed when the user logs in, or every time the user clicks on **Home**, and replaces the default dashboard.

#### Access Dashboard Tile Information

The information displayed on some tiles can be used to access all relevant data associated with it. In this example, by clicking on the **Last Changed** tile *10 Failures* message, you are taken directly to the **Managed Accounts** page, where you can get full details on the issues mentioned. You can find linked tile information by hovering your mouse over it.

#### **Change and Reset Login Passwords**

#### **Change Password and Two-Factor Authentication Settings**

If you are logging in with a BeyondInsight local user account, you can change your password and two-factor authentication app from the **Account Settings** page. You cannot change your password if you are logging in with Active Directory or LDAP credentials, or if your account is locked out.

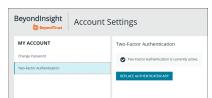

- 1. In the console, click the **Profile and preferences** icon in the top right corner.
- 2. Click Account Settings.

3. Update your password, and then click Change Password.

BeyondInsight	Account S	Settings	
MY ACCOUNT		Change Password	
Change Password		Your new password must be at least 14 characters long.	
Two-Factor Authentication		Current Password This field is required.	۲
		A New Password	۲
		Change password	۲

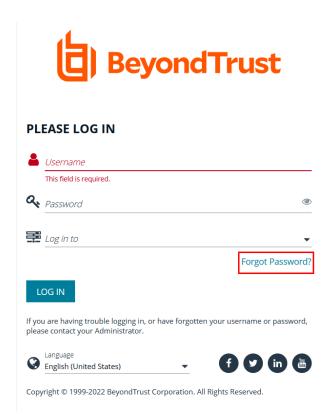

- 4. If your account has two-factor authentication enabled and registered with a device, you can update the authenticator app as follows:
  - Select Two-Factor Authentication from the My Account pane.
  - Click Replace Authenticator App.
  - Click Reconfigure Authenticator App to register a new authenticator app.

#### **Reset Password**

If you forget your console password, you can reset it as follows:

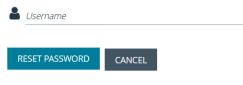

1. Click the Forgot Password link.

2. Enter your username, and then click **Reset Password**. An email containing a reset link is sent to the address associated with your username.

#### **RESET PASSWORD**

Password reset instructions will be sent to the email address associated with the username. If you have forgotten your username please contact your Administrator.

Copyright © 1999-2022 BeyondTrust Corporation. All Rights Reserved.

3. Click the link in the email to be taken to the Enter New Password page where you can change your password.

**Note:** Resetting the console password is not available to users logging in with Active Directory or LDAP credentials.

#### **ENTER NEW PASSWORD**

Your new password must be at least 14 characters long.

New Password	۲
Confirm New Password	۲
RESET PASSWORD	

If you are having trouble resetting your password, please contact your BeyondTrust Support Team.

### **Change and Set the Console Display Preferences**

You can change the information displayed on BeyondInsight pages, including the columns, filters, grid size, and logos.

#### **Set Display Preferences**

You can set display preferences on grids and pages throughout your BeyondInsight instance.

**Note:** You can display domains and filter by domains. If the domain name is not known or the asset is not part of a domain, the field is blank. By default, the **Domain** filter is not displayed.

- 1. Select an area of the site, such as Assets.
- 2. Above the grid, the following options and icons are available:
  - Refresh: Updates the displayed information with recent changes.
  - Download: Downloads the displayed information as a CSV file.
  - Columns Chooser: Select the columns to change the column headings and information displayed in the grid.
  - Grid Configuration: Choose the grid layout: Compact, Default, or Expanded.
  - Expand Grid: Enlarge the display area. When selected, the icon changes. It can be clicked again to Collapse Grid.

Note: Some options are not applicable to some grids, so fewer icons may display on those grids.

- 3. An option to change the number of displayed Items per page is located below the grid.
- 4. The changes appear dynamically as they are selected.

#### **Filter Records**

Create a filter to match records you want to view on a page.

- 1. Select an area of the site, such as Assets.
- Above the grid, there are options for filtering. The filter options available vary based on the page or grid selected. However, some common filtering options include:
  - **Smart Group filter:** Select to filter information by Smart Group association.
  - Create Date filter: Select to filter by a specific period or a custom date range.

ASSETS							
Smart Group filter All Assets	Last Updated filter     Last 90 days	- Operating System	T Atter by				
Create New Asset						C ≛ □ (	• 0
4 items	Domain	Operating System	Asset Type	Solution	Asset Risk	Last Updated *	
0	DOMAIN	Windows Server 2016 Standard	Domain Controller	8.8		Nov 05, 2020, 3:10 PM	
0		Windows	Workstation			Nov 05, 2020, 12:55 PM	
0	WORKSROUP	Windows 10 Enterprise N	Workstation	8		Oct 30, 2020, 11:16 AM	
0	EXAMPLE	Windows Server 2016 Datacenter	Domain Controller	8.8		Oct 28, 2020, 11:54 AM	

- Filter by: Choose to filter the information by Domain, Operating System, Workgroup, etc., or other details specific to the information displayed. For each filter selected, enter the content you want to search for in the filter box's text field.
- 3. Apply as many filters as desired.
- 4. The information dynamically changes to match the selections.
- 5. Filter selections persist if the page is reloaded. To remove a filter, click the X on the filter.

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

#### **Customize Console Logos**

As a BeyondInsight administrator, you can add corporate logos to replace default brand logos in the management console.

**Note:** The word "BeyondInsight" remains in the footer text on the **Login** page. This cannot be changed. After an upgrade, you must repeat these steps, because the upgrade overwrites the customized images and sets them back to default.

Replace the following three SVG image files found in <install path>/webconsole/assets/images/:

- app-logo-default.svg (normal logo)
- app-logo-darkmode.svg (black and white version of the logo)

**Tip:** The images must be 450px × 67px.

### **Role-Based Access**

BeyondInsight offers a role-based delegation model so that you can explicitly assign permissions to groups on specific product features based on their role. Users are provisioned based on the permissions of their assigned groups.

You can create BeyondInsight local groups, or you can use existing Active Directory, Azure Active Directory, or LDAP groups.

**Note:** By default, an **Administrators** user group is created. The permissions assigned to the group cannot be changed. The user account you created when you configured BeyondInsight is a member of the group.

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

#### **Create and Edit Directory Credentials**

A directory credential is required for querying Active Directory (AD), LDAP, and Azure AD, and also for adding AD, LDAP, and Azure AD groups and users in BeyondInsight. Follow the steps below for creating each type of directory credential.

**Note:** Before you can create an Azure AD credential, you must first register and configure permissions for an application in the Azure AD tenant where the user credentials reside. For more information, please see <u>Register and Configure an Application in Azure Active Directory</u> at <u>https://www.beyondtrust.com/docs/beyondinsight-password-safe/bi/authentication/azure-ad-appregistration.htm</u>.

- 1. Navigate to Configuration > Role Based Access > Directory Credentials.
- 2. Click Create New Directory Credential.

BeyondInsight	Configuration Note Based Access

A	ActiveDirectory

3. Follow the steps in the below sections based on the type of directory you are creating.

<sup>©2003-2022</sup> BeyondTrust Corporation. All Rights Reserved. Other trademarks identified on this page are owned by their respective owners. BeyondTrust is not a chartered bank or trust company, or TC: 12/1/2022 depository institution. It is not authorized to accept deposits or trust accounts and is not licensed or regulated by any state or federal banking authority.

20

#### **Create an Active Directory Credential**

- 1. Select Active Directory for the Directory Type.
- 2. Provide a name for the credential.
- 3. Enter the name of the domain where the directory and user credentials reside.
- 4. Enable the **Use SSL** option to use a secure connection when accessing the directory.

**Note:** If **Use SSL** is enabled, SSL authentication must also be enabled in the BeyondInsight configuration tool.

- 4. Enter the credentials for the account that has permissions to query the directory.
- 5. Enable the **Use Group Resolution** option to use this credential for resolving groups from the directory.

\*

**Note:** Only one credential can be set for group resolution per domain or server.

- Click Test Credential to ensure the credential can successfully authenticate with the domain or domain controller before saving the credential.
- 7. Click CreateCredential.

#### **Create an LDAP Credential**

- 1. Select LDAP for the Directory Type.
- 2. Provide a name for the credential.
- 3. Enter the name of the LDAP server where the directory and user credentials reside.
- 4. Enable the **Use SSL** option to use a secure connection when accessing the directory.

**Note:** If **Use SSL** is enabled, SSL authentication must also be enabled in the BeyondInsight configuration tool.

- 5. Enter the credentials for the account that has permissions to query the directory.
- 6. Enable the **Use Group Resolution** option to use this credential for resolving groups from the directory.

*Note:* Only one credential can be set for group resolution per LDAP server.

- Click Test Credential to ensure the credential can successfully authenticate with the domain or domain controller before saving the credential.
- 8. Click Create Credential.

#### **Create an Azure Active Directory Credential**

- 1. Select Azure Active Directory for the Directory Type.
- 2. Provide a name for the credential.
- 3. Paste the **Client ID**, **Tenant ID**, and **Client Secret** that you copied when registering the application in your Azure AD tenant.
- 4. Enable the **Use Group Resolution** option to use this credential for resolving groups from the directory.

*Note:* Only one credential is supported per Azure AD tenant.

- 5. Click **Test Credential** to ensure the credential can successfully authenticate with the domain or domain controller before saving the credential.
- 6. Click Save Credential.

#### **Edit a Directory Credential**

1. From the Directory Credentials grid, click the vertical ellipsis for the credential, and then select Edit.

2. Make the changes required.

**Note:** For AD or LDAP credentials, if you change the **Domain** or **LDAP Server**, enable or disable the **Use SSL** option, or update the **Username** or **Bind DN**, you must change the password. Click **Change Password** to display fields to enter and confirm the new password.

- Click Test Credential to ensure the edited credential can successfully authenticate with the domain or domain controller before saving the credential.
- 4. Click Save Credential.

\*

**Note:** To use Azure Active Directory credentials for logging into BeyondInsight, the accounts must use SAML authentication. For more information on configuring Azure AD SAML with BeyondInsight, please see <u>Configure Azure Active Directory SAML</u> with BeyondInsight SAML at <u>https://www.beyondtrust.com/docs/beyondinsight-password-safe/bi/authentication/security-</u> provider.htm#configure-azure-ad.

#### Map Directory Credentials to a Domain

Domain management allows you to map a default primary directory credential and an optional fallback credential as preferred binding credentials used for account resolution against domains in your environment when logging in to BeyondInsight.

**Note:** If credentials are not mapped, or both mapped credentials fail, BeyondInsight attempts login following the legacy process of not using mapped credentials.

Follow these steps to add or edit primary and secondary credentials for a domain:

- 1. Navigate to Configuration > Role Based Access > Domain Management.
- 2. Click Create New Domain to create a new one.
- 3. Provide the name of the domain or LDAP server.
- 4. Select the type of platform.
- 5. Select a **Primary Credential** from the dropdown.
- 6. Select a Fallback Credential from the dropdown.
- 7. Click Create Domain.
- To edit credentials for an existing domain, select the domain, make your edits, and then click Save Domain.

DOMAINS Edit PkAD1 n name or LDAP Serve philit ø Q Search Domains Create New Domain 🚯 Platform Showing all 4 Domains Active ŵ ŵ Credentials Ŵ phone and 1254 867890123458789012345678901254567890 Û phost engine

*Tip:* Primary and fallback credentials can include Password Safe managed accounts.

When domain management is configured for a domain and user selects the domain when logging into BeyondInsight, the specified primary and fallback credentials are used to resolve their account. The credentials used for authentication are shown in the **Login Details** for the specific login activity on the **Configuration > General > User Audits** page.

#### **Create and Configure Groups**

Create user groups and user accounts so that your BeyondInsight administrators can log in to BeyondInsight.

When a user is added to a group, the user is assigned the permissions assigned to the group.

You can create BeyondInsight local groups, as well as add Active Directory, Azure Active Directory, and LDAP groups into BeyondInsight.

Users not assigned

**Note:** By default, new groups are not assigned any permissions. You must assign permissions on features and smart groups after creating a new group. For more information on permissions and how to assign them, please see "Assign Group Permissions" on page 40.

**Note:** When a local user logs in to BeyondInsight for the first time using SAML authentication, BeyondInsight provisions their account by mapping it to the groups assigned to their account.

For releases prior to 21.3, and for upgrades to the 21.3 release, if the user account's group membership has changed (in the SAML claims provided) upon subsequent logins, BeyondInsight does not deprovision the user by removing them from the groups that were initially mapped to their account. Instead, BeyondInsight maps the user to any newly assigned groups, in addition to the groups their account is already mapped to.

You can configure BeyondInsight to synchronize group membership each time a local user logs in using SAML, as follows:

- 1. Navigate to Configuration > Authentication Management > Authentication Options.
- 2. Under SAML Logon for Local Users, toggle the Enable Group Resync option to enable it.

For new installs of release 21.3 and later releases, this option is enabled by default.

#### Add an Active Directory Group

Active Directory group members can log in to the management console and perform tasks based on the permissions assigned to the group. The group can authenticate against either a domain or domain controller. Upon logging into BeyondInsight, users can select a domain from the **Log in to** list on the **Login** page.

**Tip:** The **Log** *in to* list is only displayed on the **Log***in* page when there are either Active Directory or LDAP user groups created in the BeyondInsight console. The **Log** *in to* list is displayed by default, but may be disabled / enabled by an admin user by toggling the **Show list of domains/LDAP servers on log***in* page setting from **Configuration > System > Site Options** page.

Note: Active Directory users must log in to the management console at least once to receive email notifications.

- 1. Navigate to Configuration > Role Based Access > User Management.
- 2. Under Groups, click Create New Group.
- 3. Select Add an Active Directory Group.

#### **Propagate Domain Changes**

Domain changes can be propagated to all users in a group. By default, this is set to OFF. When enabled, changes to the preferred domain controller at the group level are applied to all group members.

When creating a new group, we advise turning this setting on by editing the new group details. This ensures that all users in the new group get a Preferred Domain Controller from the initial setup of the group.

#### Add an Azure Active Directory Group

Azure Active Directory (AD) group members can log in to the management console using SAML authentication and perform tasks based on the permissions assigned to the group. Upon logging into BeyondInsight, users can select a domain from the **Log in to** list on the **Login** page.

Tip: The Log in to list is only displayed on the Login page when there are either Active Directory or LDAP user groups created in the BeyondInsight console. The Log in to list is displayed by default, but may be disabled / enabled by an admin user by toggling the Show list of domains/LDAP servers on login page setting from Configuration > System > Site Options page.

Note: AD users must log in to the management console at least once to receive email notifications.

- 1. Navigate to Configuration > Role Based Access > User Management.
- 2. Under Groups, click Create New Group.
- 3. Select Add an Azure Active Directory Group.

## **Assign Group Permissions**

### **Permissions**

Permission	Description
No Access	Users cannot access the selected feature. In most cases, the feature is not visible to the users.
Read Only	Users can view selected areas, but cannot change information.
Full Control	Users can view and change information for the selected feature.

Permissions for a BeyondInsight user must be assigned cumulatively and at the group level. You must assign permissions on features and Smart Groups after creating a new group in order for users in that group to be able to access features in the product. For example, if you want a BeyondInsight administrator to manage discovery scans only, then you must assign full control for the following features:

- Management Console Access
- Asset Management
- Reports Management
- Scan Job Management
- Scan Management

**Note:** In addition to the group permissions noted, for the group to be provisioned, there must be at least one enabled Smart Group on the group. This sets the scope for the features.

#### **Assign Features Permissions**

- 1. From the left navigation pane in the console, select **Configuration**.
- 2. Under Role Based Access, select User Management.
- 3. Click the vertical ellipsis button for the group, and then select View Group Details.
- 4. Under Group Details, select Features.
- 5. Filter the list of features displayed in the grid using the Show and Filter by dropdown lists.
- 6. Select the features you wish to assign permissions to, and then click **Assign Permissions** or the vertical ellipsis button.
- 7. Select Assign Permissions Read Only, Assign Permissions Full Control, or Disable Permissions.

Show All Features	Filter by	View Details
Assign Permissions		+ Assign Permissions Read Only
8 items (1 selected)		+ Assign Permissions Full Contro
Feature Name   Change	Permission No access	C Disable Permissions
Password Safe Domain Management	Full Control	G

The following table provides information on the features permissions you can assign to your groups.

Feature	Provides Permissions To:
Analytics & Reporting	Log in to the console and access Analytics & Reporting to generate and subscribe to reports.
	<b>Note:</b> After you create a group, go to the <b>Analytics &amp; Reporting Configuration</b> page and run the process daily cube job. Data between the management console and the reporting cube must be synchronized.
Appliance (U-Series)	Grant access to manage the U-Series Appliance as a BeyondInsight user.
Asset Management	Create Smart Rules.
	Edit and delete buttons on the Asset Details window.
	Create Active Directory queries.
	Create address groups.
Attribute Management	Add, rename, and delete attributes when managing user groups.
Audit Manager	Audit Manager on the Configuration page in the management console.
Credential Management	Add and change credentials when running scans and deploying policies.
Directory Credential Management	Grant access to the configuration area where directory credentials are managed. This feature must be enabled to support access to directory queries as well.
Directory Query Management	Grant access to the configuration area where directory queries are managed.
	<b>Note:</b> Access to Directory Credential Management must also be granted.
Domain Management	Grants the user permission to configure mappings of bind credentials to domains for account resolution.
Endpoint Privilege Management	Grant access to the Endpoint Privilege Management features, excluding Policy Editor and Reporting.
Endpoint Privilege Management Policy Editor	Grant access to the Endpoint Privilege Management Policy Editor feature.
Endpoint Privilege Management Reporting	Grant access to the Endpoint Privilege Management Reporting feature.
Endpoint Privilege Management for Unix & Linux	Grant access to the Endpoint Privilege Management for Unix & Linux features.
File Integrity Monitoring	Work with File Integrity rules.
License Reporting	View the <b>Licensing</b> folder in <b>Analytics &amp; Reporting</b> (MSP reports, Privilege Management for Windows, Privilege Management for Mac true-up reports, and Assets Scanned report).
Management Console Access	Access the BeyondInsight management console.
Manual Range Entry	Allow the user to manually enter ranges for scans and deployments rather than being restricted to smart groups. The specified ranges must be within the selected smart group.
Option Management	Change the application options settings (for example, account lockout and account password settings).
Options - Connectors	Access the configuration area where connectors are managed.
Options - Scan Options	Access the configuration area where scan options are managed.

Feature	Provides Permissions To:
Password Safe Account Management	Grant read or write permissions to the following features on the <b>Managed Accounts</b> page and through the public API:
	Bulk delete accounts
	Add accounts to a Quick Group
	Remove accounts from a Quick Group
	Add, edit, and delete accounts
Password Safe Admin Session	Password Safe web portal admin sessions.
Password Safe Admin Session Reviewer	Grant a user admin session reviewer permissions only.
Password Safe Global API Quarantine	Access to the Quarantine APIs.
Password Safe Bulk Password Change	Change more than one password at a time.
Password Safe Domain Management	Check the <b>Read</b> and <b>Write</b> boxes to permit users to manage domains.
Password Safe Role Management	Allow a user to manage roles, provided they have the following permissions: <b>Password Safe Role</b> <b>Management</b> and <b>User Account Management</b> .
Password Safe System Management	Read and write managed systems through the public API.
Password Safe Ticket System Management	This feature is not presently used.
Protection Policy Management	Activate the protection policy feature. User groups can deploy policies, and manage protection policies on the <b>Configuration</b> page.
Reports Management	Run scans, create reports, and create report categories.
Scan - Audit Groups	Create, delete, update, and revert audit group settings.
Scan - Job Management	Activate Scan and Start Scan buttons.
	Activate Abort, Resume, Pause, and Delete on the Job Details page.
Scan - Policy Manager	Activate the settings on the Edit Scan Settings view.
Scan - Port Groups	Create, delete, update, and revert port group settings.
Scan - Report Delivery	Allow a user to set report delivery options when running a scan:
	Export Type
	Notify when complete
	Email report to
	Include scan metrics in email (only available for All Audits Scan)
Scan Management	Delete, edit, duplicate, and rename reports on the Manage Report Templates page.
	Activate New Report and New Report Category.
	Activate the Update button on the Edit Scan Settings view.
Session Monitoring	Use the session monitoring features.

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

Feature	Provides Permissions To:
Smart Rule Management – Asset	Grants permission to create and edit asset Smart Rules; editing is limited to Smart Rrules that are enabled for groups the user is a member of.
	<b>Note:</b> Newly created Smart Rules created by a non-administrator are automatically enabled with read permissions for all groups that the user is a member of, and with full permissions for all groups that the user is a member of AND has the Asset Management permissions for. For more information, see "Use Smart Rules to Organize Assets" on page 68.
Smart Rule Management – Managed Account	Grants permission to create and edit managed account Smart Rules; editing is limited to smart rules that are enabled for groups the user is a member of.
	<b>Note:</b> Newly created Smart Rules created by a non-administrator are automatically enabled with read permissions for all groups that the user is a member of, and with full permissions for all groups that the user is a member of AND has the Asset Management permissions for. For more information, see "Use Smart Rules to Organize Assets" on page 68.
Smart Rule Management – Managed System	Grants permission to create and edit managed system Smart Rules; editing is limited to smart rules that are enabled for groups the user is a member of.
	<b>Note:</b> Newly created Smart Rules created by a non-administrator are automatically enabled with read permissions for all groups that the user is a member of, and with full permissions for all groups that the user is a member of AND has the Asset Management permissions for. For more information, see "Use Smart Rules to Organize Assets" on page 68.
Smart Rule Management – Policy User	Grants permission to create and edit policy user Smart Rules; editing is limited to smart rules that are enabled for groups the user is a member of.
	<b>Note:</b> Newly created Smart Rules created by a non-administrator are automatically enabled with read permissions for all groups that the user is a member of, and with full permissions for all groups that the user is a member of AND has the Asset Management permissions for. For more information, see "Use Smart Rules to Organize Assets" on page 68.
Team Passwords	Provides access to Team Passwords for all members of the selected group.
Ticket System	View and use the ticket system.
Ticket System Management	Mark a ticket as inactive. The ticket no longer exists when <b>Inactive</b> is selected.
User Accounts Management	Add, delete, or change user groups and user accounts.
	A minimum of read access to Directory Credential Management must also be granted to enable creation of AD and LDAP Groups.
User Audits	View audit details for management console users on the <b>User Audits</b> page.

## **Edit and Delete Groups**

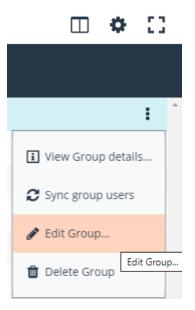

## **Edit Basic Group Details**

Administrators can edit the following basic details for groups:

- For BeyondInsight local groups, administrators can change the active status, name, and description.
- For Active Directory groups, administrators can change the active status, credential, and domain controller.
- For LDAP groups, administrators can change the active status, credential, group membership attribute, and account naming attribute.

Follow these steps to edit a group:

- 1. From the left navigation pane in the console, select Configuration.
- 2. Under Role Based Access, select User Management.
- 3. Optionally, filter the list of groups in the grid by Type, Name, Description, or Last Synchronization Date.
- 4. Click the vertical ellipsis for the group, and then select Edit Group.

45

- 5. In the Edit Group pane, update the details as required, and then click Update Group.
- For BeyondInsight local groups, administrators can change the active status, name, and description.
- For Active Directory groups, administrators can change the active status, credential, and domain controller.
- For LDAP groups, administrators can change the active status, credential, group membership attribute, and account naming attribute.

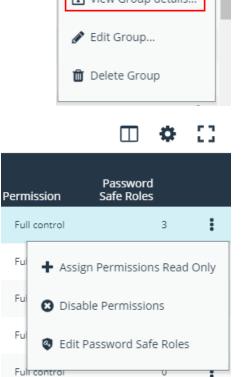

## **Edit Advanced Group Details**

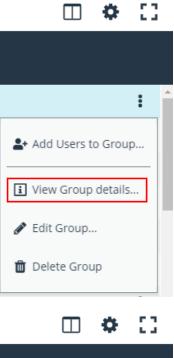

Administrators can edit advanced details, such as update permissions for features and smart groups, edit Password Safe roles, add and remove users from local groups, sync group users for Active Directory and LDAP groups, and update the API registrations.

#### **Update Group Permissions for Features and Smart Groups**

- 1. On the User Management page, optionally filter the list of groups in the grid by Type, Name, Description, or Last Synchronization Date to locate the group.
- 2. Click the vertical ellipsis button for the group, and then select **View Group Details**.

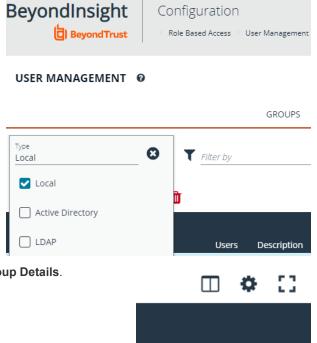

3. Select the desired features or Smart Groups, click the ellipsis button for the feature or Smart Group, and then select to assign or disable permissions accordingly.

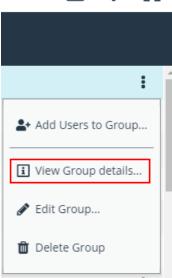

#### **Remove Users from Local BeyondInsight Groups**

1. On the User Management page, filter the grid by local groups.

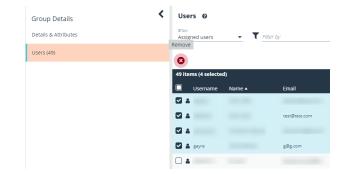

2. Click the vertical ellipsis button for the group, and then select View Group Details.

47

- 3. Under Group Details, select Users.
- 4. Filter the **Users** grid to show assigned users.
- 5. Select the user or users, and then click the **Remove** button.

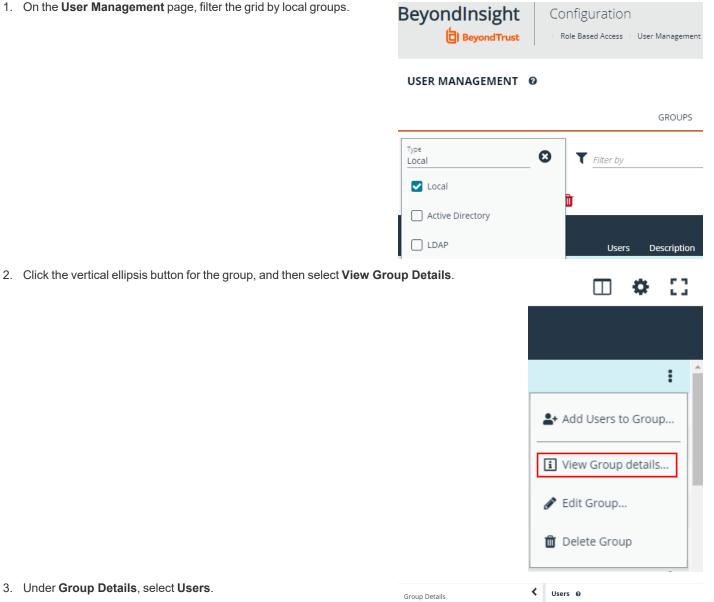

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

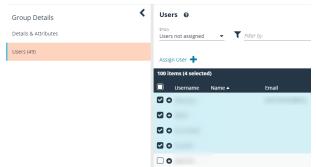

#### Add Users to Local BeyondInsight Groups

1. On the User Management page, filter the grid by local groups.

- 3. Under Group Details, select Users.
- 4. Filter the Users grid to show unassigned users.
- 5. Select the user or users, and then click Assign User.

48

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

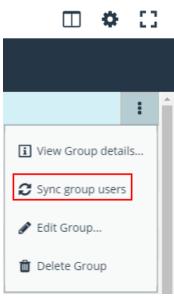

#### Sync Group Users for Active Directory and LDAP Groups

1. On the **User Management** page, filter the grid by Active Directory and LDAP groups.

#### USER MANAGEMENT @

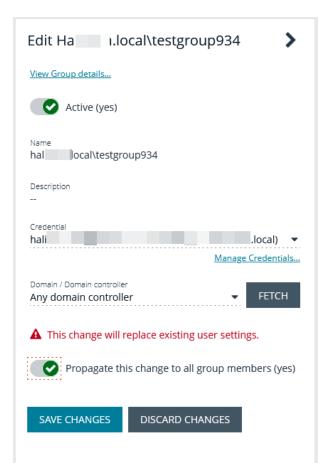

2. Click the vertical ellipsis button for the group, and then select **Sync Group Users**.

## **Propagate Domain Changes**

Domain changes can be propagated to all users in a group. By default, this is set to OFF. When enabled, changes to the preferred domain controller at the group level are applied to all group members.

When creating a new group, we advise turning this setting on by editing the new group details. This ensures that all users in the new group get a Preferred Domain Controller from the initial setup of the group.

#### **Delete a Group**

Administrators can delete groups as follows:

- 1. From the left navigation pane in the console, select Configuration.
- 2. Under Role Based Access, select User Management.
- 3. Optionally, filter the list of groups in the grid by Type, Name, Description, or Last Synchronization Date.
- 4. Select a group, and then click the **Delete** button above the grid, or click the vertical ellpsis button for the group, and then select **Delete Group**.

## **Create and Manage User Accounts**

User accounts create the user identity that BeyondInsight uses to authenticate and authorize access to specific system resources. You can create local BeyondInsight users, as well as add Active Directory, Azure Active Directory, and LDAP users into BeyondInsight.

**Note:** A user account must be a member of a BeyondInsight group. If a user is not a member of any groups in BeyondInsight, the user cannot log in to the console.

## **Create a BeyondInsight Local User Account**

- 1. Navigate to Configuration > Role Based Acess > User Management.
- 2. Click Users to display the list of users in the grid.
- 3. Click Create New User.
- 4. Select Create a New User.

USER MANAGEMENT ©						
	GROUPS		USERS			
T Riter by						÷
Create New User 🚭					٥	0

- 9. Select a user, and then click Add User.
- 10. Assign at least one group to the user.

### **Edit a User Account**

Administrators can edit user details such as change the name, username, email, and password, update active status, lock and unlock the account, and update multi-factor authentication settings as follows:

- 1. From the left navigation pane in the console, select Configuration.
- 2. Under Role Based Access, select User Management.
- 3. Click Users to display the list of users in the grid.
- 4. Optionally, filter the list of users displayed in the grid using the Filter By dropdown.
- 5. Select a user, click the vertical ellipsis button, and then select **Edit User Details**.
- 6. In the Edit User pane, update the details as required, and then click Update User.

## **Propagate Domain Changes**

The preferred domain controller for a user is set by the group they are in, provided that the group was created with the propagate option turned on, and that this action happened before the user was set up.

If you want to change the preferred domain controller for a user, edit the user, select an appropriate credential, and then select a different preferred domain controller from the list.

\*

**Note:** Any future change to the preferred domain controller at the group level can overwrite this setting if the propagate switch is turned on.

For more information on creating and editing directory credentials, please see "Create and Edit Directory Credentials" on page 19.

## **Delete a User Account**

Administrators can delete user accounts as follows:

- 1. From the left navigation pane in the console, select Configuration.
- 2. Under Role Based Access, select User Management.

- 3. Click **Users** to display the list of users in the grid.
- 4. Optionally, filter the list of users displayed in the grid using the Filter By dropdown.
- 5. For local accounts, select the user, click the **Delete** button above the grid, and then click **Delete** to confirm.
- 6. For directory accounts, select the user, click the vertical ellipsis, select **Delete User**, and then click **Delete** to confirm.

**Note:** If a user account is linked to any Password Safe session recordings, you cannot delete it for auditing reasons; however, you may disable the account.

Note: Directory accounts may be deleted only if they do not belong to any groups.

## Audit Console Users in BeyondInsight

You can track the following activities of users logging into the console:

- Login and logout times
- IP address from where the user logged in
- Password change events
- Other actions taken such as configuring user settings

To view user audit data, follow the steps.

- 1. Select Configuration.
- 2. Under General, select User Audits.
- 3. Select a filter. You can filter results by Action, Section, Username, IP Address, Item, and Detail.

\*

**Note:** You can also configure display preferences and filters to refine the information displayed. For more information, please see "Change and Set the Console Display Preferences" on page 16.

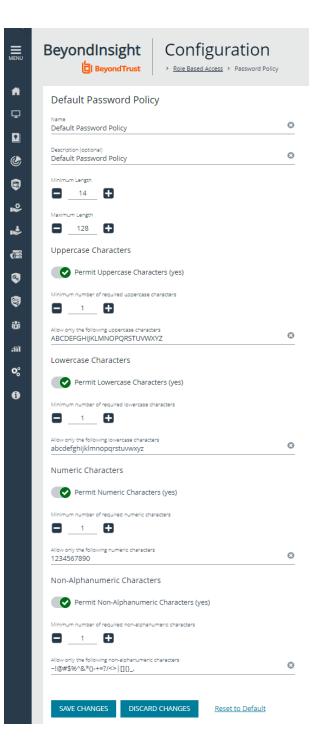

*Tip:* You can view more details for a specific user audit by clicking the *i* icon for the item. You can also export all of the data in the grid to a CSV file by clicking the **Download all** button above the grid.

## **Create a Default Password Policy**

You can create a password policy to set the password complexity requirements for local BeyondInsight users. This includes, for example, the minimum and maximum length, numeric characters, non-alphanumeric characters, etc. You can create only one policy.

- Navigate to Configuration > Role Based Access > Password Policy.
- 2. Enter a name for the policy and an optional description.
- 3. Set the minimum and maximum password length, and select the types of characters to be used: lowercase, uppercase, numeric, and non-alphanumeric characters.
- 4. Click **Save Changes** when done. You can also discard changes or reset to default if desired.

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

# **Overview of BeyondInsight Tools**

BeyondInsight provides a set of tools to help you organize assets for scanning.

Depending on the number of assets that you want to scan or the critical nature of some of your assets, consider organizing the assets using address groups or Active Directory queries which can be part of a Smart Rule.

The following list provides examples on ways you can use these tools:

- Create an IP address group that organizes assets by a range of IP addresses, including CIDR notation and named hosts.
- Use an Active Directory query that will organize assets by organizational unit. Create a Smart Rule and use the query as your selection criteria.
- Change the properties for assets, and then use the attributes as the selection criteria in the Smart Rule.

Scans can return a lot of information. To help you review scan results, you can create filters and set preferences on the Assets page to easily review scan results.

For more information, please see "Change and Set the Console Display Preferences" on page 16.

depository institution. It is not authorized to accept deposits or trust accounts and is not licensed or regulated by any state or federal banking authority.

## **Create an Address Group**

When creating a Smart Rule, you can create an address group to use as an IP address filter. An address group can contain included or excluded IP addresses. IP addresses are entered as a

- Single IP address
- IP range
- CIDR Notation
- Named host

**Note:** The BeyondInsight user must be a member of the **Administrators** group or be assigned the **Full Control** permission on the **Asset Management** feature to be able to create Smart Rules.

For more information, please see "Create and Configure Groups" on page 25.

#### **Create an Always Address Group**

You can create an address group and name it **Always**. The Discovery Scanner is designed to recognize this address group name and includes the group in every scan, regardless if the group is selected in the scan job. The address group can include and exclude IP addresses.

The next time a scan runs, the address group is synchronized with the Discovery Scanner. The IP addresses, whether they are included or omitted, are considered part of the running scan.

**Example:** If the **Always** address group is configured with **10.10.10.60** and **buffett-laptop** (omitted), it scans **10.10.10.50** and **buffett-laptop**. The results are as follows:

- The scan includes 10.10.10.60 since this IP address was added to the Always address group.
- The scan excludes buffett-laptop since this asset was explicitly omitted in the Always address group.
- 10.10.10.50 is scanned as usual.

**Note:** If an asset was scanned and later added to the **Always** address group as **Omit**, the asset is not scanned but might be displayed in the report. This only occurs with some reports.

1. Select Configuration.

2. Under Discovery Management, select Address Groups.

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

Group.

## **Create a Directory Query**

You can create an Active Directory or LDAP query to retrieve information from Active Directory or LDAP to populate a Smart Rule. To work with directory queries, the BeyondInsight user must be a member of the **Administrators** group or assigned the **Asset Management** permission.

Create a new directory query or clone an existing query as follows:

- 1. In the BeyondInsight Console, navigate to Configuration > Role Based Access > Directory Queries.
- 2. Click Create New Directory Query + or click the vertical ellipsis for an existing query and select Clone.
- 3. Select Active Directory or LDAP from the Directory Type list.

Note: Cloned queries keep the same directory type as the query being cloned.

- 4. Enter a name for the query in the **Title** field.
- 5. Select a stored credential for running this query or click **Create New Credential** to be taken to the **Directory Credentials** page where you can add a new one.

**Note:** At minimum, the credential must have **Read** permissions on the computer assets you are enumerating.

- 6. Enter the directory path for the Query Target, or click Browse to search for a path and add it.
- 7. Select a scope to apply to the container: This Object and All Child Objects or Immediate Children Only.
- 8. Select an object type: Computer Objects or User Objects.
- 9. Enter the directory path for the Query Target, or click Browse to search for a path and add it.
- 10. Select a scope to apply to the container: This Object and All Child Objects or Immediate Children Only.
- 11. Select an object type: Computer Objects or User Objects.
- 12. Enable or disable the Dynamically refresh results each use option.
- 13. Provide a Name and Description or use the \* wild card character to match multiple values for the Basic Filter.
- 14. Optionally, click Advanced Filterto provide an LDAP Query.
- 15. Click Test to ensure the query returns expected results.
- 16. Click Create Directory Query.

For more information, please see the following:

- "Create and Configure Groups" on page 25
- "Create and Edit Directory Credentials" on page 19

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

## **Attributes and Attribute Types**

Attributes can be used to label assets, and you can set attributes for each asset in a group using a Smart Rule. BeyondInsight ships with a default set of attributes that can be customized, except for the **Criticality** type, and you can also add new attribute types and attributes to meet your requirements.

For more information, please see "Use Smart Rules to Organize Assets" on page 68.

### Add a New Attribute Type

- 1. In the BeyondInsight Console go to Configuration > General > Attributes.
- 2. Click + Add New Attribute Type.
- 3. Type a name for the attribute type, and then press Enter.

# **Use Smart Rules to Organize Assets**

A Smart Rule is a filter that you can use to organize assets into Smart Groups. Use an asset-based Smart Rule to organize assets based on the filters selected.

**Note:** The BeyondInsight user must be a member of the **Administrators** group or be assigned the **Full Control** permission on the **Asset Management** feature to be able to create Smart Rules.

When a non-administrator user creates a Smart Group, the Smart Group is automatically associated with:

- · Read permissions for all groups the user is a member of
- Full Control permissions for all groups the user is a member of and has the Asset Management permissions for

Use a Smart Rule to register assets as Smart Groups. This allows you to:

- Run Discovery Scans
- Monitor and view assets

Smart Rules update results automatically, ensuring assets match the criteria and are current.

## **Use Smart Rule Filters and Smart Groups**

There are many built-in filters available that you can use when creating Smart Rules. You can also create address groups or Active Directory queries from the **Configuration** page to use as Smart Rule filters.

#### Selection Criteria $\, \Box \,$

Inclu	de Items that match ALL 🔻 of the following	
	Address Group	
and	Address Group	-
	Asset fields	Ī
	Assets With Open Tickets	
	Assigned Attributes	
and	Child Smart Rule	

You can use more than one filter to refine or extend the scope of assets in a Smart Rule. Filters can be joined with **and** (match **ALL** criteria) or **or** (match **ANY** criteria) conditions. If you select to match **ALL**, every indented filter must be set to **True** for an asset to be included. If you select to match **ANY**, only one of the indented filter items must be set to **True** for an asset to be included. The screen capture shows a filter example that includes all assets in the EMEA domain that are either servers or workstations.

# BeyondTrust

70

	You can include more than one asset field filter in the Smart Rule to refine the results.
Assets with Open Tickets	For ticket tracking, create a Smart Rule that filters on open tickets. The Smart Rule filter can be set to include overdue tickets.
Assigned Attributes	Create a filter based on an attribute.
	If the attribute is unassigned on a particular asset, you can choose to include or exclude the asset from the rule.
Child Smart Rule	You can reuse a Smart Rule to save time when creating new Smart Rules. This is especially useful if the Smart Rule is a complicated set of filters.
	Reusing a Smart Rule further refines the assets that will be a part of the Smart Rule.
Cloud Assets	Filter assets on the cloud connector.
Directory Query	Create an Active Directory or an LDAP query to include or exclude assets in the selected domain.
Installed Software	Filter on any combination of installed software.
MAC Address	Filter by MAC address of assets.
Operating System	Filter on any combination of OS. Operating systems included in the list are those detected in your network.
	Assets with no OS detected, can be included or excluded from the rule.
Processes	Filter on any combination of processes.
Services	Filter by any combination of services.
Software Version	Filter by software version. The software that you can filter on is determined by the software that is discovered during the scan.
User Account Attribute	Filters user accounts by SID or privilege. You can filter on both. If either value is not selected then it will be ignored.
	Using this filter you can determine if any users have administrator privileges that might no longer be required.
	You can create a Smart Rule using this filter and set the email alert action to notify you when a user account with admin privileges is detected.
Windows Events	Filter by Windows events that are available in the Windows Event Viewer. For example, <b>Application</b> , <b>Security</b> , or <b>System</b> .
Workgroup	Filter by workgroup.

## **Predefined Smart Group Categories**

Agents and Scanners	Detects assets where BeyondInsight scanners are deployed.
Assets and Devices	Includes default Smart Groups for all assets and all assets labeled as workstations.
Intelligent Alerts	Includes Smart Groups that detect assets added since the previous day, and mobile assets with critical vulnerabilities. Intelligent Alerts are inactive by default.
Servers	Includes Smart Groups that detect mail server, web server, database server, domain controller, and SCADA assets. Only the <b>Web Servers</b> Smart Group is marked as active.
	Includes Smart Groups for virtual environments, including <b>Microsoft Hyper-V</b> and <b>Parallels</b> . Assets detected as virtual environments belong to these Smart Groups.
Virtualized Devices	This default category also includes two Smart Groups: <b>Virtual Servers</b> and <b>Virtual Workstations</b> . Assets that are servers or workstations might not be detected, and as a result, not be included in the Smart Group. For example, the asset might be a router or unknown, resulting in exclusion from the Smart Group.

# BeyondTrust

72

## **Create Smart Rules**

You can configure an asset-based Smart Rule to:

- Create Smart Groups
- Send email alerts with a list of assets
- · Set attributes on assets
- Create a ticket with a list of assets
- Set scanner pooling

## **Create an Asset Based Smart Rule**

- 1. From the left menu in the BeyondInsight Console, click Smart Rules.
- 2. Leave Asset selected for the Smart Rule type filter.
- 3. Click Create Smart Rule.
- 4. Select a category.
- 5. Enter a name and description.
- 6. By default, the Smart Rule is set to **Active (yes)**, so it is always available for processing. Disable the active setting to ensure the rule is not processed.
- 7. Select the filters in the Selection Criteria section.
- 8. From the Actions section, select one of the following:

Create Ticket	Select tickets parameters, including ticket assignment, severity, and email alert.
Export Data	Select to manage a Smart Group for the BMC Remedy connector.
Mark each asset for deletion	Select to create a Smart Group that contains assets to be marked for deletion.
Mark each asset inactive	Assets detected as inactive are no longer be displayed on the <b>Assets</b> page or in reports.
Send an email Alert	Select and enter the email addresses for notification when the rule criteria is matched. Emails are only sent if the list of assets that match the rule is changed from the last time the rule was processed.
Set attributes on each asset	Select the attribute type from the list, and then select the attribute.
Set Scanner Properties	Select one or more scanners to lock to the Smart Group.
Set attributes on each asset	Select attributes for each asset.
	When selected, the rule is displayed in the Smart Groups pane as a Smart Group. You can select the Smart Group to filter the list of assets in the Smart Groups pane.
Show asset as Smart Group	You can also select the default view to display on the <b>Assets</b> page when the Smart Group is selected.
	Smart Groups are also used for running scans and registering for patch updates.

9. Click Create Smart Rule.

## **Smart Rule Processing**

A Smart Rule processes and updates information in Smart Groups when certain actions occur, such as the following:

- The Smart Rule is edited and saved.
- A timer expires.
- You manually kick off the processing by selecting the Smart Rule from the grid on the Smart Rules page, and then click Process.

**Note:** The **Process** action from the grid on the **Smart Rules** page does not apply to Managed Account Quick Group Smart Rules, because these only run once upon creation and cannot be triggered to run again.

- A Smart Rule with Smart Rule children triggers the children to run before the parent completes.
- Managed account Smart Rules with selection criteria Dedicated Account process when a change to a mapped group is detected. This can occur in the following scenarios:
  - A new user logs on.
  - The group refreshes in Active Directory by an administrator viewing or editing the group in **Configuration > Role Based Access > User Management**.

## **Change the Processing Frequency for a Smart Rule**

By default, Smart Rules process when asset changes are detected. The assets in the Smart Rule are then dynamically updated. For Smart Rules that require more intensive processing, you might want Smart Rules to process less frequently.

To provide more restrictive processing, you can select alternate frequency settings to override the default processing. The Smart Rules process in the selected time frame (for example, the rule processes once a week).

When creating a new Smart Rule or updating an existing one, select your desired frequency from the **Reprocessing limit** list in the **Details** section.

•	Note: A Smart Rule is always processed when first saved	0
	updated.

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

## **Perform Other Smart Rule Actions**

## **Clone a Smart Rule**

You can clone custom or predefined Smart Rules.

- 1. From the left menu in the BeyondInsight Console, click Smart Rules.
- 2. Click the vertical ellipsis button for the Smart Rule you wish to clone, and then select Clone.
- 3. If you are using the multi-tenant feature, select the organization from the list, and then click Clone Smart Rule.
- 4. Select the newly cloned Smart Rule from the grid, click the vertical ellipsis button, select **View Details**, and then edit the Smart Rule filters as needed.
- 5. Click Save Changes.

Note: Cloning a Smart Rule also clones the user group permissions.

## **Deactivate a Smart Rule**

You cannot delete predefined Smart Rules. However, if you have several smart groups, you can mark unused Smart Rules as inactive.

*Note:* A Smart Rule that is used in another Smart Rule cannot be deleted or marked as inactive.

An inactive Smart Group is no longer displayed in the Smart Group browser pane until marked active again.

To deactivate a Smart Rule:

- 1. From the left menu in the BeyondInsight Console, click Smart Rules.
- 2. Select the Smart Group or multiple Smart Groups, and then click Deactivate above the grid.

#### **Delete a Smart Rule**

- 1. From the left menu in the BeyondInsight Console, click Smart Rules.
- 2. Select the Smart Rule.
- 3. Click the **Delete** icon above the grid.

Note: A Smart Rule that is used in another Smart Rule cannot be deleted or marked as inactive.

## **Smart Rule Options**

The **Smart Rule Omni Worker Options** allow you to configure multiworker node usage, the number of Smart Rule threads per type, and the failure thresholds.

**Multi-Node Processing**: Off by default. Enable this to allow assignment of Smart Rules to process specific worker nodes. Choosing a worker node for a Smart Rule to process is accomplished by setting the **Target Processing to Workgroup** action on the Smart Rule in question. When enabled, this allows multiple Omni Workers to process Smart Rules.

#### IMPORTANT!

For the following options to be available, you must enable **Multi-Node Processing**. An all Omni Worker restart is required to enable this processing.

- Asset Threads: (Default 5) Choose a number of threads to use for processing asset based Smart Rules.
- Managed Account Threads: (Default 5) Choose a number of threads to use for processing managed account based Smart Rules.
- Managed System Threads: (Default 5) Choose a number of threads to use for processing managed system based Smart Rules.
- **Policy User Threads**: (Default **5**) Choose a number of threads to use for processing policy based Smart Rules.
- Force Re-queued if stale: (Default 12) Choose a number of hours after which an unprocessed Smart Rule is considered stale and requeued for processing.
- Failure cool off threshold: (Default 5) Choose a number of times to let a Smart Rule process fail after which a cool-off period is observed.
- Failure cool off skip time: (Default 60) Choose a number of minutes to wait before trying to process the Smart Rule again after reaching the failure cool off threshold.

Click **Update Smart Rule Omni Worker Options** when you have finished setting the options.

# Additional Multi-Node Processing Information

Configuration **BeyondInsight** BeyondTrust > General > Smart Rule Options **SMART RULE OMNI WORKER OPTIONS** Configure multi-worker node usage, number of Smart Rule threads per type, and failure thresholds Multi-Node Processing Asset Threads 5 Ð Between 1 and 20 Managed Account Threads 5 🕂 Between 1 and 20 Managed System Threads 5 Ð Between 1 and 20 Policy User Threads 5 Ð Between 1 and 20 Force Re-queued if stale 🗖 12 🕀 Between 1 and 40 (hours) Failure cool off threshold 5 🕂 Between 3 and 10 (failures) Failure cool off skip time 60 🕂 Between 20 and 200 (minutes)

The Multi-Node Processing feature was added to allow more granular control over the performance of smart rule processing.

#### Impact of Multi-Node Processing

Multi-node processing is a combination of features:

- Controls the number of nodes and threads per node that are used for processing different types of Smart Rules.
- Restricts the processing of certain Smart Rules to specific nodes if required. This might come into play if the Smart Rule is built on a directory query that only one worker node has access to. Trying to process a Smart Rule like this across all Omni Workers would result in occasional failures if the node doing the processing lacks the necessary access to run the directory query.
- Controls certain behaviors in failure scenarios. The defaults should be sufficient, but are adjustable to give more control to support assisting customers in this area.
- When multi-node processing is turned off, then Smart Rule processing occurs on a single node using *N* threads, where *N* is configurable per Smart Rule **TYPE** in the configuration user interface (**Asset Threads**, **Managed Account Threads**, **Managed System Threads**, and **Policy User Threads**). While better than the historical single-threaded model, this can still be a lot of work for the Omni Worker and might cause poor performance in other areas (password rotations, event forwarding, etc.).
- When multi-node processing is turned on, then Smart Rule processing is shared across ALL worker nodes, using *N* threads per worker node, where *N* is configurable per Smart Rule **TYPE** in the configuration user interface (**Asset Threads**, **Managed Account Threads**, **Managed System Threads**, and **Policy User Threads**).
- The default setting for each Smart Rule type is 5 threads. The valid range is between 1 and 20 threads.
- Changes to the multi-node processing settings, as well as changes to thread counts and changes to failure scenario handling, can be made anytime but do not take effect until all Omni Worker services are restarted. This restart is a manual step. There is no risk to enabling or disabling these settings during production times, but you will not see any change in processing until Omni Worker services are restarted.

#### **Overall Best Practices**

The **Multi-Node Processing** setting is turned off by default. Turning it on is beneficial if multiple worker nodes or Omni Workers are available, and if the existing Omni Workers are running at full capacity. If turning this feature on doesn't help Omni Worker performance, support should be contacted.

The lower the thread count, the less benefit you may get from turning this setting on. However, setting the thread count too high can also result in problems if your Omni Worker or worker nodes are not powerful enough to handle the load. Start with the default and adjust up or down as necessary.

#### **Reason for Multi-Node Processing**

Before this feature was added, Smart Rule processing was only supported in a single-threaded model running in RemManagerService. Moving it to Omni Worker allows it to be multi-threaded on a single node. Adding the multi-node option allows Smart Rule processing to be scaled out even further.

#### **Multi-Node Processing Environment**

This feature is used in an environment with multiple worker nodes or Omni Workers, where an Omni Worker is taxed by Smart Rule processing.

#### Assign a Rule to a Node

If multi-node processing is turned on and a Smart Rule contains a specific criteria or action that only works if executed on a particular worker node, then that Smart Rule is expected to get an action of **Targeted to Workgroup** set. The Omni Worker or worker node that executes this Smart Rule should be manually set to the same work group under **Worker Nodes**. Some examples of criteria or actions that

77

only work on a particular node are directory queries that run on a specific network, or database account onboarding that runs on a specific network. Any network-specific Smart Rules are likely candidates to target a specific worker node.

#### **Troubleshooting Methods**

#### Smart Rule Grid

Three optional columns have been added to the Smart Rule grid to give some extra visibility into Smart Rule processing: **Processed Date** (checks to see if any rules were not processed recently), **Successful Attempts**, and **Failed Attempts**. Other columns that are helpful are **Reprocessing Limit**, **Average Time**, **Last Attempt**, and **Processing Status**.

#### • Dynamic Dashboard

Troubleshooting also includes checking the Omni Worker Dynamic dashboard in the user interface (administrators only). There you can see the Omni Worker agents, queued messages, messages sent to dead-letter (undeliverable letters, reached the limit of processing attempts), and messages actively being processed.

#### Health Dashboard

This dashboard shows stats regarding issues on worker nodes, slowest Smart Rules, failed Smart Rules, and errors in the system.

Logfiles

There is one log file per Omni Worker. Because this can be hard to read across environments, we have added the **System Event Viewer** and **System Event Settings** features. Enabling **System Event Database Recording** logs error or warning messages from across the system into the BeyondInsight database so they can be viewed and searched using the **System Event Viewer**. Purging these events from the database is configurable. The default is **5** days.

#### **Issues with Feature**

The feature has been developed to avoid deadlocks, race conditions, memory leaks, etc., as part of our development and QA process. However, it is possible that some issues still exist. Contact BeyondTrust Support with any issues that arise for resolution.

#### **Changed Behaviors in the Database**

On its own, multi-node processing does not make changes in the database. Any database changes to schemas, tables, views, procedures, etc., that are required for this and other features in BeyondInsight are made during an upgrade, whether this feature is enabled or not. If the **Enable System Event Database Recording** setting is turned on, then database entries are made for warnings or errors in the system. Purging is enabled for this data, and the time frame is configurable.

#### Logged Nodes

Each Omni Worker has its own logs. Logging takes place across multiple nodes when this setting is turned on. The **System Event Viewer** shows any issues that are occurring.

#### **Failover Processing**

Existing support for worker node or Omni Worker service failover also encompasses the Smart Rule processing function. In the event of a failover situation, the secondary node picks up where the primary node leaves off.

### **View and Select Smart Rules Processing Statistics**

The Smart Rules grid displays some processing statistics by default. Additional Smart Rules processing statistics, such as **Processed Date**, **Successful Attempts**, and **Failed Attempts** are available and can be displayed in the Smart Rules grid.

To add this information to the grid:

- 1. From the left menu in the BeyondInsight Console, click Smart Rules.
- 2. Click the Column chooser icon in the upper right of the grid.
- 3. Click the desired column to add that information to the grid.
  - Check marks indicate columns currently displayed.
    - You can remove a displayed column by clicking the column name in the Column chooser list.
    - If there are more columns displayed than can fit in the width of the screen, a scroll bar appears at the bottom of the grid. It may be necessary to scroll sideways to view any additional columns.

# Add Credentials for Use in Scans

You can create the following credential types that can be used for scans:

- Microsoft SQL Server
- MySQL
- Oracle
- SNMPv2
- SSH
- Windows

To create a credential:

- 1. Select Configuration > Discovery Management > Credentials.
- 2. Click Create New Credential.
- 3. Select a credential type from the **Type** list.

Note: The fields of information you need to enter change based on the type selection.

4. Enter the user account information appropriate for the type of credential you are creating:

Туре	Information
MS SQL Server	<ul> <li>Authentication Type</li> <li>Domain (Optional)</li> <li>Username</li> <li>Password</li> <li>Confirm password</li> <li>Description</li> <li>Port numbers</li> <li>Key</li> <li>Confirm key</li> </ul>
MySQL	<ul> <li>Username</li> <li>Password</li> <li>Confirm password</li> <li>Description</li> <li>Port numbers</li> <li>Key</li> <li>Confirm key</li> </ul>
Oracle	<ul><li>Username</li><li>Password</li></ul>

Teradata	<ul><li>Username</li><li>Password</li><li>Confirm password</li></ul>

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

	<ul> <li>Description</li> <li>Host</li> <li>Port numbers</li> <li>Key</li> <li>Confirm key</li> </ul>
SNMPv2	<ul> <li>Description</li> <li>Key</li> <li>Confirm key</li> <li>Community string</li> </ul>
SSH	<ul> <li>Authentication Type</li> <li>Userrname</li> <li>Password</li> <li>Confirm password</li> <li>Description</li> <li>Port numbers</li> <li>Key</li> <li>Confirm key</li> <li>Elevation</li> </ul>
Windows	<ul> <li>Domain (Optional)</li> <li>Username</li> <li>Password</li> <li>Confirm password</li> <li>Description</li> <li>Key</li> <li>Confirm key</li> </ul>

Note: All credentials are stored in the database using an AES-256 block cipher by RijndaelManaged.

*Tip:* This feature propagates credentials stored in BeyondInsight to Discovery Scanner servers and allows end users and API calls to leverage credentials locally on the network scanner. This eliminates the need to provide credentials separately for those scanners.

If the credential name matches an existing credential in the BeyondTrustDiscovery Scanner, the credential is overwritten with the value from BeyondInsight.

5. Click Create New Credential.

٦

82

If creating Oracle, SSH, or SNMP credentials, please see the following:

- "Create SSH Credentials" on page 85
- "Create Oracle Credentials" on page 83
- "Create SNMP Credentials" on page 84

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

## **Create Oracle Credentials**

If you are scanning Oracle databases, you can create Oracle credentials. The **tnsnames.ora** file is updated automatically after you create an Oracle credential.

- 1. In the BeyondInsight Console, navigate to Configuration > Discovery Management > Credentials.
- 2. Click Create New Credential +.
- 3. From the **Type** list, select **Oracle**.
- 4. Provide a Username, Password, and Description.
- 5. Select an Access level from the list: Standard, SYSDBA, or SYSOPER.
- 6. Select additional connection options:
  - Connect To: Select from: Database or Named Service.
  - Protocol: Select a protocol: TCP, TCPS, or NMP.
  - Hosts: Enter the host name where the Oracle database resides. If this credential is used for multiple Oracle hosts, separate each host name by a comma.
  - Port Numbers: Enter a port number, or multiple port numbers separated by commas.

**Note:** IPv4 addresses, IP address ranges, CIDR notation, and named hosts are supported formats. Multiple SIDs, named services, TCP ports, and pipe names are not supported.

7. Enter a key and confirm it.

**Note:** The **Key** and **Confirm Key** fields display only when your administrator has enabled the global site setting to require access keys for discovery credentials.

8. Click Create New Credential.

## **Create SNMP Credentials**

If scanning devices are managed by an SNMP community, you can add your community strings.

- 1. In the BeyondInsight Console, navigate to Configuration > Discovery Management > Credentials.
- 2. Click Create New Credential.
- 3. From the Type list, select SNMPv2.
- 4. Enter a **Description**.
- 5. Enter a key and confirm it.

**Note:** The **Key** and **Confirm Key** fields display only when your administrator has enabled the global site setting to require access keys for discovery credentials.

- 6. Enter the Community String.
- 7. Click Create New Credential.

## **Create SSH Credentials**

You can create Public Key Encryption credentials to connect to SSH-configured targets. You can select a credential that contains a public and private key pair used for SSH connections.

Optionally, when configuring SSH, you can select to elevate the credential. Using **sudo**, you can access scan targets that are not configured to allow root accounts to log on remotely. You can log on as a normal user and use **sudo** to connect with a more privileged account. Additionally, you can use **sudo** to elevate the same account to get more permissions. Using **pbrun**, you can elevate the credential when working with Privilege Management for Unix & Linux target assets.

- 1. In the BeyondInsight Console, navigate to Configuration > Discovery Management > Credentials.
- 2. Click Create New Credential.
- 3. From the Type list, select SSH.
- 4. Select an authentication type.
  - Plain text: Enter a Username and Password.
  - Public Key: Upload a private key file, and then enter a Username and Passphrase. A public key is generated based on the contents of the private key.
- 5. Enter a Description.
- 6. Enter a key and confirm it.

**Note:** The **Key** and **Confirm Key** fields display only when your administrator has enabled the global site setting to require access keys for discovery credentials.

- 7. Enter a port number, or multiple port numbers separated by commas.
- 8. Elevating credentials is optional. To elevate credentials, select one of the following from the **Elevation** list:
  - **sudo:** The optional sudo username should be blank in most cases. When blank, commands run with the effective privileges of the root account. If an optional username is entered, sudo runs in the security context of that user.
  - Enable: Enter the credentials for Cisco devices. If you are auditing Cisco devices, you can elevate the credentials to privileged for more thorough scans.
  - **pbrun:** Enter the pbrunuser username.
- 9. Click Create New Credential.

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

# **Run Discovery Scans**

Run a discovery scan to locate network assets, such as workstations, routers, laptops, and printers. A discovery scan also determines if an IP address is active. You can periodically repeat discovery scans to verify the status of devices, programs, and the delta between the current and previous scans.

Note: Discovered assets do not count toward your license.

- The TCP discovery ports are 22, 80, 110, 139, 389, 443, 445, 1025, 1433, 1521, 3306, 3389, 5000, 5432, and 27017.
- Use more than one scanner to distribute the coverage across the network.

## Use the Scan Wizard to Create a Discovery Scan

- 1. Click Run a New Discovery Scan on the left menu.
- 2. Select Scan Type: There are two types of scans to choose from. Select one and click Next.
  - **Discover Local Accounts**: This scan requires credentials and deploys a local scan service to the scan targets. This scan discovers systems as well as the local user accounts located on them.
  - Detailed Discovery Scan: This scan requires credentials and it deploys a local scan agent to the scan targets, which can be disabled if required. Besides systems, this scan provides associated information on services, scheduled tasks, users, and databases.
- 3. Select Scan Targets: Enter scan targets in the field provided. You can enter single IP addresses, IP ranges, addresses in CIDR notation, or named hosts. Items must be separated by commas.
- Choose Scan Agent: Select which agents are used to execute the scan. If more than one agent is selected, the scan targets are split between the selected agents. If you have a large number of agents, you can use the filter dropdown menu. Click Next to continue.

**Note:** A warning banner appears at the top of the screen if your installation includes any Discovery Agents earlier than version 20.1. These must be updated by the end of 2021. You can identify outdated agents by referring to the grid of agents on this screen, which includes the version of each agent.

Click **Dismiss** to hide the warning banner until your next login. Dismissing the warning banner here does not hide it on the dashboard, and dismissing the warning banner on the dashboard does not hide it on this screen.

5. Enter Credentials: If the type of scan you select requires credentials, you can select a credential from the Credential List, and/or use the Custom Credential section to provide a credential to use for this scan.

• If you enter a **Custom Credential**, click **Test Credential** to verify its functionality.

\*

**Note:** Clicking **Test Credential** tests only AD domain user accounts. It is not for use with local or SSH user accounts.

• If using the **Credential List**, select one or more credentials from a list of available credentials.

<sup>©2003-2022</sup> BeyondTrust Corporation. All Rights Reserved. Other trademarks identified on this page are owned by their respective owners. BeyondTrust is not a chartered bank or trust company, or TC: 12/1/2022 depository institution. It is not authorized to accept deposits or trust accounts and is not licensed or regulated by any state or federal banking authority.

 If keys are required for discovery credentials in your environment, either provide a key for each credential or enable the Use the same key for all selected credentials option to provide a Universal Configuration Key used for all selected credentials.

Note: Configuration keys are not used or validated for Password Safe credentials.

Tip: Use the Search Credentials box to filter the list of available credentials.

**Tip:** If you require a credential that isn't listed, click the **Create New Credential** hyperlink at the top of the **Credential List** section to open the **Create New Credential** form and create a new credential. The new credential is added to the list of existing credentials.

- 6. Once credentials have been selected for the scan, click Next.
- 7. Name the Scan: Provide a unique name for this scan. The scan name cannot be longer than 58 characters and cannot contain any of the following characters: []' \$ & < + ? > \* |":; \/. You can also set the following Discovery Options:
  - Apply job restrictions that allow you to abort the scan if it runs longer that a set number of minutes.
  - Toggle the option to enable or disable the use of a local scan service.

**Note:** Disabling the local scan service prevents the discovery of IIS app pools, Scheduled Tasks, and domain user information.

- Set a schedule, which can be Immediate, One Time, or Recurring.
- 8. Click Finish to complete the Scan Wizard.

## **Run Scans from a List of Assets**

If you want to run a scan but would prefer to select targets from a list of assets rather than type them, click Assets from the left menu.

From the **Assets** grid, select the assets you want to scan, and then click **Scan Selected Assets**.

	Assets			Endpoint Privilege Ma

The Scan Wizard screen appears. Here you can select the type of scan to run. The difference is that when you click **Next** and go to the **Select Scan Targets** page, you will find the targets already selected. The next steps in the Scan Wizard are the same as those outlined above.

BeyondInsight	
RUN A SCAN	SELECT SCAN TARGETS
1 Select scan type	Scan targets have already been selected. The scan is currently targeting 3 Assets.
2 Select scan targets	test123

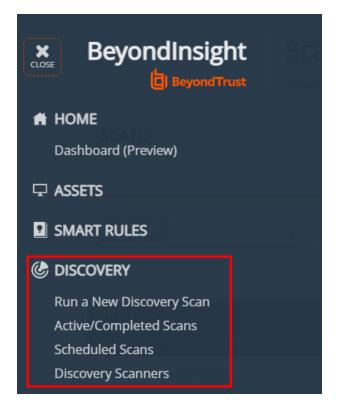

## **Use Smart Rules as Targets for Scans**

You can also run a scan on Smart Rules. From the **Smart Rules** grid, select a rule, click the vertical ellipsis for the rule, and then select **Scan**. You are taken to the Scan Wizard, for which the targets are preselected, and if the Smart Rule is configured to use specific scanners, the scan agents are also preselected. The next steps in the Scan Wizard are the same as those outlined above.

# **Check Completed and Scheduled Scans**

If you want to check information on scans click **Menu** from the left navigation bar. Under **Discovery**, click **Active/Completed Scans** or **Scheduled Scans**.

88

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

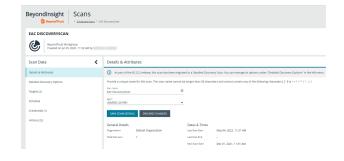

From the **Scans** page you can see active, completed, and scheduled scans, and you can delete a scan. You can also see the scan status for each active or completed scan. For each active and completed scan you can click the vertical ellipsis for the scan, and then select **Run Scan Now** or **Delete scan**. For each scheduled scan you can click the vertical ellipsis for the scan, and then select **View Scan Details**, **Run Scan Now**, or **Delete scan**.

When viewing the Scan Data, you can:

- · Change the name of the scan
- Change the scanner associated with a scheduled scan job via Details & Attributes > Agent
- · Change the Detailed Discovery Options
- View the scan targets and modify the target Smart Rule if one is selected
- Change the scheduled scan time
- · Change the credentials
- · View the history of the scan, if any exists

## **Discover Assets Using a Smart Group**

When the Smart Group filter is an address group, Active Directory query, or cloud connector, you can discover assets. When the **Use to discover new** box is checked, any assets online since the Smart Group was last processed are detected. The scan results on the **Assets** page reflect the number of assets found.

Ť

*Tip:* If you create an address group that includes the /19 CIDR block, the range possesses 8190 potential assets. The Discovery Scan always tries to discover those assets. Keep this in mind when you are reviewing scan results.

90

## **Key Steps**

To create a Smart Group, go to Configuration > General > Smart Rules > Create Smart Rule.

- Create an address group or Active Directory query that includes the IP address range or domain.
- · Create a Smart Group that includes the address group or query as the filter. Enable the Use to discover new assets during scans option.
- You can also configure the Smart Rule to use specific scanners by selecting the Set Scanner Properties action, and then selecting specific scan agents from the list.

Beyo	Configuration
>	01 Discovery: TS Servers
	Selection Criteria 🖯

	SAVE CHANGES DISCARD CHANGES

Tip: We recommend you run a discovery scan at a regular interval. You can discover assets manually by entering a host name, IP address, or address range.

For more information, please see the following:

- "Create a Directory Query" on page 65
- "Create an Address Group" on page 61

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

# Manage Scan Jobs

On the Scans page, you can:

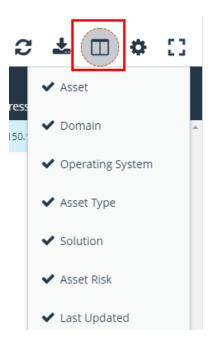

- · View active, completed, and scheduled scan jobs
- · Locate specific jobs by using the date, status, agent name, workgroup, scan name, start time, and end time filters
- Stop active scan jobs
- Edit scheduled scan jobs
- Run completed and scheduled scan jobs now

depository institution. It is not authorized to accept deposits or trust accounts and is not licensed or regulated by any state or federal banking authority.

# **Manage Assets**

The **Assets** page allows you to review details about your assets quickly by filtering your assets by last update time, type of asset, domain, operating system, technical solutions applied to the asset (for example, an asset is a scanned host or database host), DNS name, Workgroup, and IP address.

You can modify which columns to display in the **Assets** grid by clicking the **Column Chooser** icon above the grid. From here you can add or remove columns.

## **Review Asset Details**

**Tip:** Depending on the scan settings, information might not be detected and included in the scan results. If the following scan settings are turned on, more accurate scan results can be expected:

- Perform Local Scanning
- Enable WMI Service
- Enable Remote Registry Service

You can review the advanced details information for assets by clicking the vertical ellipsis button for an asset, and then selecting **Go to Advanced Details**.

			Server	8 <b>B</b>		Jun 08, 2022, 10:16 AM	
				8		jun 04, 2022, 12:01 AM	
				-	-	May 17, 2022, 11:35 AM	

## **General Data**

- Details & Attributes: Displays details about the asset such as: IP address, DNS name, domain, system name, Workgroup, date the asset was added and updated, the operation system, etc.
- Accounts: If the asset is linked to a managed system, the managed accounts on that system are listed in the grid.

*Tip:* Click the *View Managed System* link above the grid to view the advanced details for the managed system that is linked to the asset. To return to the advanced details for the asset, click the *View Asset* link.

- Application Pools: Displays IIS Application Pools discovered on the asset on the last successful scan of the system.
- Databases: Displays the databases that are on the asset and allows you to add a database.
- Smart Groups: Displays the Smart Groups that the asset is associated with.

#### **Scan Data**

**Note:** By default, the current snapshot of scan data is selected. You can select other available snapshots to load the data for that date.

- Certificates: Displays all certificates installed on the asset. You can filter by expired certificates or search for certificates.
- Hardware: Displays disk drive information, system manufacturer, memory, and processor information.
- Ports: Displays the open port number, protocol, and description.
- Scheduled Tasks: Displays information about scheduled tasks for a particular asset, including task name, task to run, last time the task ran, schedule type, etc.
- Services: Displays discovered services, including name, description, state, logon details, startup type, and dependencies.
- Software: Lists all software discovered on the asset, including version.
- Users: Includes several attributes for user accounts, including: name, privileges, password age, last logon date, password expiry status, group membership, and status of the account, and allows you to filter by these attributes.

## **Create Assets Manually**

Assets are added to BeyondInsight through discovery scans. Assets can also be manually added from the Assets page.

- 1. From the Assets page, select All Assets from the Smart Group filter dropdown.
- 2. Click Create New Asset +.
- 3. Complete the Create Asset form, and then click Create Asset.

**Note:** New assets created in any Smart Group other than **All Assets** might not appear under the selected Smart Group if the Smart Rule criteria is not met or until the Smart Rule processes. We recommend that you create new assets using the **All Assets** Smart Group.

\*

**Note:** A manually added asset can have its basic information edited, such as Name, DNS Name, Domain, Asset Type, IP Address, MAC Address, and Workgroup. Asset attributes cannot be edited at the individual asset level at this time. If this is necessary, Smart Rules can be used to modify the attributes associated with an asset.

## **Delete Assets**

You can remove assets from the **Assets** grid immediately. Assets removed from the grid are deleted from the BeyondInsight database during the nightly data purge.

1. From the **Assets** page, select an asset or multiple assets, and then click the **Delete** button above the grid.

**Tip:** You can use the filters above the grid to narrow down your list of assets to those targeted for deletion, and then check the box in the header to select all assets in the grid to delete at once.

# **U-Series Appliance**

# Log in to U-Series Appliance via BeyondInsight Console

Permissioned users have the option to log in to the U-Series Appliance directly from the **Asset** grid in the BeyondInsight Console. This eliminates the need for organizations to share their BTAdmin account. This feature also leverages BeyondInsight user audits to audit which user is logged in to which appliance when the login is initiated from the BeyondInsight **Asset** grid.

Note: Requires BeyondInsight 22.2, Discovery Scanner 22.2, and U-Series Management Software 3.5.

## **Prerequisites**

- An API key exchange must be performed between the BeyondInsight Console appliance and the remote appliances.
  - SQL Free appliances that have already exchanged must be repeated.
- The crypto key must be exchanged for the BeyondInsight database. Use one database for all your appliances.
- A working DNS lookup for each appliance is required (no support for IP addresses).

For more information, please see the following:

- On API keys, <u>Manage the U-Series Appliance API Key</u> at <u>https://www.beyondtrust.com/docs/beyondinsight-password-</u> safe/appliance/administration/security.htm
- On crypto keys, <u>Manage U-Series Appliance Security Settings</u> at <u>https://www.beyondtrust.com/docs/beyondinsight-</u> password-safe/appliance/administration/security.htm
- On crypto keys, <u>Configure U-Series Appliance Roles</u> at <u>https://www.beyondtrust.com/docs/beyondinsight-password-</u> safe/appliance/administration/configure-roles.htm

## Setup Non-Admin Users in BeyondInsight

Non-admin users must be given permissions to view and sign on to the U-Series Appliance. This is done with a permissioned SSO (Single Sign On) group.

### **Create Permissioned Group**

- 1. Log in to the BeyondInsight Console.
- 2. Go to Configuration > Role Based Access > User Management > Groups and click Create New Group.
- 3. Enter Group Name and Description and click Create Group. This opens the Group Details page.

95

:

96

- 4. In the left menu, click **Features**. Under Feature Name:
  - Select Management Console Access for access to the BI Console.
  - Select Asset Management to view appliances you have access to.
  - Select **U-Series Appliance Login** for permission to log in to the appliance.
- 5. Click Assign Permissions, then select Assign Permissions Full Control.
- 6. In the left menu, click Smart Groups. Select assets to assign to the group. U-Series Appliance must be selected.
- 7. Click Assign Permissions, and then select Assign Permissions Full Control.

## Assign SSO Users to Group

- 1. Go to Configuration > Role Based Access > User Management > Groups.
- 2. Select the permissioned group.
- 3. Click the ellipsis to the right of the goup, and then select Add Users to Group.
- Search for the user name, and then check the box beside the name to add them to the group.

Once users have been added to the permissioned group, they will see a reduced version of the BeyondInsight Console when they log in. When they click on **Assets**, they will be able to select the assets they've been permissioned under the **Smart Group Filter**.

Users can log into the U-Series Appliance in one of two ways:

- 1. Select U-Series Appliance under the Smart Group filter.
- 2. Click the ellipsis to the left of the asset, and then select Login to U-Series Appliance

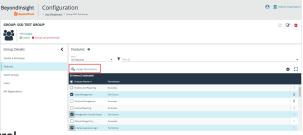

Or:

- 1. Select U-Series Appliance under the Smart Group filter.
- 2. Select the asset.
- 3. Click on the Login To U-Series Appliance button located above the grid.

For more information on creating a new user, please see <u>Create and Manage User Accounts</u> at <u>https://www.beyondtrust.com/docs/beyondinsight-password-safe/bi/user/role-based-access/user-accounts.htm</u>.

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

BeyondTrust is not a chartered bank or trust company, or TC: 12/1/2022 depository institution. It is not authorized to accept deposits or trust accounts and is not licensed or regulated by any state or federal banking authority.

Add Users to Group.

View Group details...

**Note:** Users that are delegated U-Series Appliance login permission are authenticated into the appliance(s) with admin privileges.

# Run Scans on Cloud Platforms in BeyondInsight

You can run scans on the following cloud types: Amazon EC2, VMware vCenter, Rackspace, IBM SmartCloud, Microsoft Azure, Microsoft Hyper-V, and Google Cloud.

Before you create a cloud connector, ensure the following requirements are in place.

## Amazon EC2 Requirements

To use the Amazon EC2 connector, you must adhere to the following recommendation from Amazon:

User accounts must have minimal permissions assigned (for example, describe instances).

The following minimum permissions are required to successfully enumerate a list of targets and run a scan:

- elasticloadbalancing:DescribeLoadBalancers
- ec2:DescribeInstances
- ec2:DescribeRegions
- ec2:DescribeInstanceStatus
- ec2:DescribeImages

#### **Azure Requirements**

The Azure connector extracts virtual machines and load balancers from Resource Manager. You must create an Azure Active Directory application.

You can either use the premade Reader role, or set up a new Virtual Machine Contributor role to the Azure Resource Group. You must choose where in the Azure hierarchy you are giving access — either as high as the subscription, or for a specific Resource Group. If you choose to set up a new role, the minimum permissions that must be granted are:

- Microsoft.Resources/subscriptions/resourceGroups/read
- Microsoft.Compute/virtualMachines/read .
- Microsoft.Compute/virtualMachines/instanceView/read
- Microsoft.Network/loadBalancers/read .
- Microsoft.Network/loadBalancers/frontendIPConfigurations/read •
- Microsoft.Network/networkInterfaces/read
- Microsoft.Network/networkInterfaces/loadBalancers/read
- Microsoft.Network/publicIPAddresses/read

For detailed instructions, please see Create an Azure Active Directory Application at https://docs.microsoft.com/enus/azure/active-directory/develop/howto-create-service-principal-portal.

## **Google Cloud Requirements**

• Key file: You must download a key file from the Google cloud instance. The key file is uploaded when you create the connector in BeyondInsight.

🛷 Note: The key file is not required if your BeyondInsight server is hosted on your Google cloud instance.

Compute Engine Network Viewer Role: The BeyondInsight service account that you create in the Google cloud instance requires the Compute Engine Network Viewer role.

For more information, please see Compute Engine IAM Roles at https://cloud.google.com/compute/docs/access/iam.

## **Hyper-V Requirements**

**Note:** The steps required for successful authentication vary depending on your environment. These instructions are to connect a Hyper-Vi virtual machine on the CIMV2 namespace off root (not connecting to a Hyper-V server).

#### Set Firewall

- 1. Open Windows Firewall (Start > Control Panel > Security > Windows Firewall).
- 2. Select Allow a program or feature through Windows Firewall.
- 3. Check the Windows Management Instrumentation (WMI) box, and then check the **Public** box.
- 4. At this point you can send requests but receive unauthorized exceptions, whereas previously the host would not be found.

#### Add WMI user to COM Security

- 1. Start Component Services. Using the Run command, enter dcomcnfg.exe.
- 2. Expand Component Services > Computers.
- 3. Right-click My Computer, and then select Properties.
- 4. Select the COM Security tab, and then in Access Permissions, click Edit Limits.
- 5. Add the username you are using for WMI, and then select Local Access and Remote Access.
- Click OK.
- 7. In Launch and Activation Permissions, click Edit Limits.
- 8. Add the WMI user, and then select Remote Launch and Remote Activation.

#### **Change WMI Permissions**

- 1. Start the Computer Management snap-in by using the Run command, and entering compmgmt.msc.
- 2. Expand **Services and Applications**.
- 3. Right-click WMI Control, and then select Properties.
- 4. Click the **Security** tab.
- 5. Select Root\CIMV2, and then click Security.
- 6. Add the user, and then click **Advanced**.
- 7. Double-click the user, and then check the following boxes: Enable Account, Remote Enable, and Read Security.

- 8. From the Apply to list, select This namespace and subnamespaces.
- 9. Restart the **WMI** service.

#### **Test Connection**

Use WBEMTest on the local machine (not your Hyper-V server) to test your connection.

- 1. Run wbemtest.exe from the command prompt.
- 2. Click Connect.
- 3. Enter the namespace in the format \\HOST\root\CIMV2, where host is a computer name on a domain or an IP address.
- 4. Enter a username and password.
- 5. Click Connect.

## VMware vCenter Requirements

You can scan VMware virtual machines. Ensure the following requirements are in place before you configure the VMware connector in BeyondInsight.

- Discovery Scanner 5.17 or later
- · BeyondInsight 3.5 or later
- VMware Tools must be installed on the targets that you want to scan.
- Log in to the VMware website and download the Virtual Disk Development Kit (VDDK): https://developer.vmware.com/home.
- Discovery Scanner supports only version 5.1 of the VDDK. Ensure you copy the following file: VMware-vix-disklib-5.1.0-774844.i386.exe.
- Run the VDDK installer on the scanner computer using local administrator credentials.
- BeyondInsight needs access to https://<VMware server>/sdk through port 443.

## **Configure a Cloud Connector**

- 1. In the BeyondInsight Console, go to Configuration > General > Connectors.
- 2. In the Connectors pane, click Create New Connector.
- 3. Provide a name for the connector, and then select a **Connector Type** from the list:
  - AWS Scan Target Collector
  - Azure Scan Target Collector
  - Google Cloud Scan Target Collector
  - Hyper-V Scan Target Collector
  - Rackspace Scan Target Collector
  - VMware vCenter Scan Target Collector
- 4. Enter the connector information:
  - For AWS cloud connections, required fields are: Provider, Region, Access Key ID, and Secret Access Key.

Instances associated with the region are displayed in the Connection Test Results section.

©2003-2022 Beyond Trust Corporation. All Rights Reserved. Other trademarks identified on this page are owned by their respective owners. Beyond Trust is not a chartered bank or trust company, or

depository institution. It is not authorized to accept deposits or trust accounts and is not licensed or regulated by any state or federal banking authority.

- For Azure, required fields are: Region, Client ID, Client Information, Tenant ID, and Subscription Information.
- For Google Cloud, required fields are **Server** (the region), **Project Name** (the project ID), and the **Key File**. Upload the key that you downloaded from the Google Cloud.
- Hyper-V server, required fields are: Server (IP address) and logon credentials.
- For Rackspace, required fields are Account Type, Username, and API Key.
- For VMware, required fields are Server (https://[server]/sdk), Username, and Password.
- 5. After you configure the connector, click Test Connector to ensure the connector works.
- 6. Click Create Connector.

After you create a cloud connector, you can run a scan and review the results to determine what cloud assets were discovered..

## Scan Paused or Offline VMware Images

By default, paused or offline VMs are turned on during a scan. After the scan runs, the VMs are reverted to the paused or offline state.

If you suspect that a VM is at risk, you can turn on the VM in another secure network where other VMs will not be under potential threat. The scan runs as usual, and then the VM is reverted to the paused or offline state.

When creating the connector, click the **Advanced** button. You can configure each host that is a member of the vCenter instance.

The option that you select applies to all VMs on the host.

The advanced options dialog box varies depending on your vCenter configuration. The list of available options includes all other networks configured for your vCenter instance or on your ESX server.

VMware vCenter Server	Advanced Opti	ons
vCenter Instance: 10.101.30	215	
Do NOT power on offline im	ages - scan VMDK f	ile instead. (Retina 5.17 and later)
DataCenter: ha-datacenter		
Host: E	SX05.halidom.local	
Start offline VMs on the follow	/ing network:	No Preference / Previously Configured Adapter
		No Preference / Previously Configured Adapter
		VM Network
		Disconnected Network

### Scan VMDK Files

You can scan a VMDK file rather than turning on a VM. Make sure you check the option **Do NOT power on offline images - scan VMDK file instead**.

Scan times are faster when VMs remain powered off. However, scan results might differ from scan results for VMs powered on (for example, open ports and running processes might not be detected for VMs powered off).

Center Instance:	10.100.100.20		
Do NOT power	r on offline images - scan VMDK	(file instead. (Retina 5.17 and later)	
ataCenter: Data	Center DataCenter		
ataCenter: Data Host:	Center DataCenter 10.100.100.50		
Host:		VM Network	•

## **Cloud Connector Smart Groups**

You can create Smart Groups based on the cloud connectors that you are using.

- 1. Select **Assets** from the menu.
- 2. Click the Manage Smart Rules link.

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

- 3. Click Create Smart Rule.
- 4. Select a category, and then enter a name and description.
- 5. Under Selection Criteria, select Cloud Assets, and then select the cloud connector type to filter on (Amazon, Azure, Hyper-V).
- 6. For the Amazon AWS, Azure, and Google Smart Groups, check the Use Private IP Address box to scan internal IP addresses.
- 7. Under Actions, select Show asset as Smart Group.
- 8. Click Create Smart Rule.
- 9. Run a Discovery Scan on the Smart Group to see the cloud assets in reports.
- 10. On the Assets page, select the cloud connector, and then click the vertical ellipsis button to review the details.

## **Configure BeyondInsight AWS Connector**

This section provides information on setting up an Amazon AWS connector, including details on the AWS configuration.

### Set up a Policy

- 1. Log in to the AWS Management Console.
- 2. Select Identity & Access Management.
- 3. Select Policies from the Details menu.
- 4. Select Create Policy.
- 5. Select Create Your Own Policy.
- 6. Enter a policy name and description.
- 7. Paste the following JSON into Policy Document:

```
'Version": "2012-10-17",
"Statement": [
    {
        "Effect": "Allow",
        "Action": [
            "elasticloadbalancing:DescribeLoadBalancers",
            "ec2:DescribeInstances",
            "ec2:DescribeInstances",
            "ec2:DescribeInstanceStatus",
            "ec2:DescribeInstanceStatus",
            "ec2:DescribeImages"
        ],
        "Resource": "*"
    }
]
```

Note: For "Resource": "\*", you must determine what JSON is required for your current needs. You may also need a condition with this, such as if you want only the dev group to have access to certain instances.

## Grant Access to a Third Party (Optional)

**Note:** The **ARN** and **External Name** fields are for granting access to a third party. For more information, please see <u>How to</u> Use an External ID When Granting Access to Your AWS Resources to a Third Party at https://docs.aws.amazon.com/IAM/latest/UserGuide/id\_roles\_create\_for-user\_externalid.html.

After you configure the AWS settings, you can create the connector and smart groups in the BeyondInsight Console.

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

# Work with the Multi-Tenant Feature in BeyondInsight

The multi-tenant feature in BeyondInsight allows you to define multiple organizations (or tenants) where each organization's asset data is kept isolated from all other organizations. Only Smart Rules marked as **Global** can combine asset data across multiple organizations.

Most BeyondInsight features are available with multi-tenant, including Smart Rules and connectors.

Features not available include exclusions, tickets, and report templates.

## Select Tenants on the Smart Rule Page

All of the pre-packaged Smart Rules are part of the Global Rules. When a pre-packaged Smart Rule is turned on, the Smart Rule applies to all assets in every organization. You can use the **Organization** filter in the page header next to the **Profile and preferences** icon to easily switch the rules displayed in the grid from the **Global** rules to rules for specific tenants.

≞	BeyondInsight Configuration	O international and internatio	
•	SMART RULES	North America South America	1
•	Anna han spenter - T riter tv	Central America	1
e	Create Smart Rule O	Latin America	l
•	2) Deni Congory • None Decorption	Reprocessing Limit	l

**Note:** When you initially create an organization, both the default and the new organization is provisioned with the **All Assets** Smart Rule. Also, all active built-in Smart Rules are copied from the default organization to the new organization; inactive built-in Smart Rules are not copied from the default to the new organization.

Note: Create Smart Rules as usual. For more information, please see "Use Smart Rules to Organize Assets" on page 68.

### **Quick Rules**

When you create a quick rule from the Address Group, you can select the organization.

## **Organization Filters**

When working with more than one customer, use the **Organization** filter to see assets and Discovery Scanner agents associated only with a particular customer.

The Organization filter is displayed only if more than one active organization is available to the currently logged-on user.

Many pages in the console are organization- aware and reflect the organization chosen in your profile. However, other pages may still require you to select an organization on that page. If there is no saved value for the organization in your profile, the **Global** organization is default.

## **Address Groups**

You can organize address groups by organization. When working in the **Address Groups** configuraton area, you can select an organization and see the address groups specific to that organization.

## **Reassign Related Items**

To migrate existing organization-aware items to a different organization:

 SALES: www.beyondtrust.com/contact

 TC: 12/1/2022

- 1. From the menu, select **Configuration**.
- 2. Under General, select Organizations.
- In the Organizations pane, click Actions icon next to the name of the organization you wish to migrate, and then click Reassign Related Items.
- 4. Check the box next to the items you wish to migrate:
  - Address Groups
  - Credentials
  - Policy Users
  - Workgroups
- 5. Click the Select an organization drop down menu, and then select the name of the organization you wish to migrate the items to.
- 6. Click the Reassign Items button.

#### Select a Workgroup

For unknown assets (assets not scanned by BeyondInsight), you must select a workgroup associated with the organization. Assets might be unknown when using the settings:

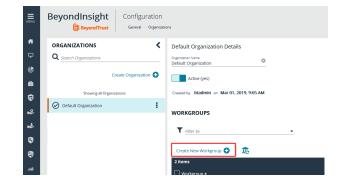

- Single IP address
- IP range
- CIDR notation
- Named hosts

For known assets (assets detected and in the BeyondInsight database), a workgroup does not need to be selected. The assets are already associated with a workgroup. Assets are known when using the settings:

- Currently selected Smart Group
- Currently selected Assets

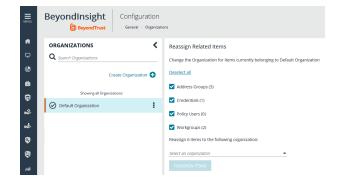

#### Create a New Workgroup

- 1. From the menu, select Configuration.
- 2. Under General, select Organizations.
- 3. In the Organization Details panel, under Workgroups, click the Create New Workgroup link.

105

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

4. In the **Create New Workgroup** pane, enter a **Workgroup Name**, and then click the **Create Workgroup** button.

CREATE NEW WORKGROUP	
Manually create a new Workgroup in Default Organization	
Workgroup Name BeyondTrust TechCom	0
CREATE WORKGROUP

Change the Organization of an existing Workgroup to Default Organization

**Q** Search Workgroups

## Set Up Organizations

#### **Create a Workgroup**

The Users Accounts Management feature is required to assign workgroups to an organization.

Each Discovery Scanner must be assigned a workgroup. A workgroup is typically created when the agent is initially deployed.

You can add and delete workgroups. However, you cannot rename workgroups.

You can delete a workgroup only if it is not associated with an organization, mobility connector, or Discovery Scanner.

Use the Events Client Configuration tool to create a workgroup.

- 1. Log on to the asset where the agent resides.
- 2. Start the Events Client Configuration Tool.
- Select the Enabled Application tab, and check the box for the agent.
- 4. Select the Workgroup tab and enter a name and description.
- 5. Click OK.

Events Client Settings	×	
	ificate Scheduler

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

## Add an Organization

An organization is automatically populated with an All Assets Smart Group.

- 1. Select Configuration, and then click Organizations.
- 2. Click Create Organization.
- 3. Enter the name of the organization, and then click Create.
- 4. The Active option is enabled by default and must be enabled to successfully run scans on the tenant's assets.
- 5. Click Workgroups.
- 6. Click the edit icon for the organization, and then select the organization.
- 7. Click the check mark to save the changes.

## **Create a Group for a Tenant**

You can create a group for a tenant. The users in the group can then log in to BeyondInsight and run reports. When creating the user group, ensure that you assign the BeyondInsight permission. Additionally, assign **Read** permissions to the tenant's Smart Rules. The users can then run reports based on the Smart Rules.

\*

**Note:** Creating a group for a tenant is optional and only required if your client wants to run reports from BeyondInsight. For more information, please see "Role-Based Access" on page 18.

As a security measure, a tenant cannot log in to BeyondInsight.

# **Set BeyondInsight Options**

## **Set Account and Email Options**

If you use Clarity, for configuration information please see <u>Configure Clarity Analytics</u> at https://www.beyondtrust.com/docs/beyondinsight-password-safe/bi/analytics/configure.htm#Clarity.

## **Account Lockout Options**

You can set lockout options, such as lockout threshold and duration.

- 1. Select Configuration.
- 2. Under Role Based Access, select Local Account Settings.
- 3. Under Account Lockout, set the following options:
  - Account Lockout Duration: Sets the number of minutes that the user is locked out after they hit the account lockout threshold. Once this time has elapsed, an attempt will be made to unlock the account during the user's next log in. Setting this value to 0 (zero) requires the account to be manually unlocked by an administrator.
  - Account Lockout Threshold: Sets the number of times a user can try their password before the account is locked out.
  - Account Lockout Reset Interval: Sets the number of minutes after an account is locked due to unsuccessful entry attempts before resetting the lockout counter.
  - Unlock account upon password reset request: When set to Yes, unlocks the account when the Forgot Your Password process is followed by the user. When set to No, the user may reset their password using the Forgot Your Password process, but the account remains locked until an administrator unlocks it.
  - Send lockout notification: When set to Yes, sends a notification to the email address configured in the Lockout Notification Recipients when any account becomes locked out.
  - Lockout notification recipients: Sets the email address where the lockout notification is sent. The Send Lockout Notification switch must be set to Yes for this to be relevant.
- 4. Click Update Account Lockout Options.

## **Account Password Options**

You can set account password parameters, such as a complexity requirement and password length.

- 1. Select Configuration.
- 2. Under Role Based Access, select Local Account Settings.
- 3. Under Account Password, set the following options:
  - Enforce Password History: Enter the number of passwords a user must create before an old password can be reused. Enter 0 to not enforce a password history. There are no restrictions on using past passwords when 0 is entered.
  - Maximum Password Age: Enter the maximum number of days before a password must be changed.
  - Minimum Password Age: Enter the minimum number of days that a password must be used before it can be changed.
- 4. Click Update Account Password Options.

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

#### **Email Notifications**

The email notification functionality allows BeyondInsight to send email under certain circumstances. This includes, but is not limited to, emails sent upon ticket assignment, password reset, user lockout notifications, smart rule actions, or API authentication failures.

**Note:** Email SMTP settings are initially set in the BeyondInsight configuration tool. Verify these settings are accurate and that you use the same information. Changes made here will be reflected in the configuration tool.

- 1. Select Configuration.
- 2. Under System, select Email Notifications.
- 3. Enter an email address in the **From email address** box. This sets the email address that appears in the **From** and **Reply-To** fields for email notifications sent by BeyondInsight.
- 4. Optionally, enable the **Notify administrator on cloud connector failure** setting. When enabled, this option sends an email if an error occurs while collecting cloud data using a connector configured in BeyondInsight.
- 5. Click Update Email Notification Options.

Note: An email is sent every 24 hours.

#### **Set Support Options**

You can use the following support options to assist with troubleshooting issues with BeyondInsight:

- Select log levels for BeyondInsight services log files.
- Enable and configure system event recording. This feature consolidates selected events from multiple log files to the BeyondInsight database and displays this data in the System Event Viewer grid.
- · View recorded system events.

#### **Select File Log Levels**

- 1. From the Home page in the BeyondInsight Console, select Configuration.
- 2. In the Support pane, select File Log Levels.

# BeyondTrust

- 3. For each service, select the desired logging level:
  - The options are Verbose, Debug, Information, Warning, and Error.
  - The default for all services is Information.
  - Verbose and Debug create a large volume of entries and should be used only when necessary.
- 4. Click Update Settings.
- 5. Changes take effect in about 30 seconds. Services do not need to be restarted.

Configuration

Support > File Log Levels

#### FILE LOG LEVELS

The logging level for each of these services can be configured here. Once a change is made, within about 30 seconds, the new logging level will be used. Services will receive these changes automatically, they do not need to be restarted. Please note, Debug and Verbose logging levels will result in a high volume of log file entries and should generally be used only as needed. The default log level for all file logging is "Information".

# BeyondTrust

#### **Enable System Event Recording**

- 1. From the Home page in the BeyondInsight Console, select Configuration.
- 2. In the Support pane, select System Event Settings.
- 3. Click the toggle to Enable System Event Database Recording.
- 4. From the System Events Severity Level to Record dropdown, select:
  - Warning, to record warnings and errors
  - Error, to record errors only
- 5. Set the number of days to retain recorded events in the field **Purge System Events Older Than**.

Note: Once events are purged, they are not available in the System Event Viewer.

#### **System Event Viewer**

**Note:** System event recording must be enabled (as above) to view events in the **System Event Viewer**.

- 1. From the Home page in the BeyondInsight Console, select Configuration.
- 2. In the Support pane, select System Event Viewer.
  - This screen shows the events recorded and retained as per the **System Event Settings**.
  - The list of events can be filtered by Event Time and additional filters can be added.
  - On the right, above the column headings, there are icons to refresh and download the list of events, and to modify the appearance of the list, including adding or removing columns.
  - You can sort any column by clicking on the heading. An arrow appears to indicate whether the sort is ascending or descending. Click again to reverse the sort.

## Set Data Retention and Advanced Purging Options

When data is initially collected, it is stored as unprocessed data in the BeyondInsight database. After the data is processed and made available in the management console and reports, the unprocessed data is no longer needed. To maintain a manageable database size, the unprocessed data is purged at regular intervals. Go to **Configuration > System > Data Retention** to manage BeyondInsight's data retention.

#### **Data Retention**

#### Maintenance

To maintain a manageable database size, the unprocessed data is purged at regular intervals. These intervals are for the purging of Vulnerability Management data and can be configured here.

Note: Vulnerability Management has been deprecated and will be removed from the product in a future version.

Purge general events older than	Sets the number of days to keep the data sent by the agents. General events can include events like checking in and trying to connect to assets, and firewall events which might indicate that the scan cannot process because of a firewall blocking the connection. The default number of days is <b>7</b> .
Purge attacks older than	Sets the number of days to keep attack data that was discovered by the protection agent. Recommended: <b>90 days</b> .
Purge application events older than	Sets the number of days to keep the application events sent by the agents. The default value is <b>7</b> .
Purge scans older than	Sets the number of days to keep the information defined in the scan settings. Recommended: <b>7 days</b> .
Purge scan events older than	Sets the number of days to keep the data collected in scans. Recommended: <b>7 days</b> .
Purge attack events older than       Sets the number of days to keep the data sent by the protection agents.         Recommended: 7 days.	
Purge discovery agent jobs every N days	When enabled, sets the number of days to keep the discovery data collected by the agents. Recommended: <b>1 day</b> .

Click Update Maintenance Options to save your option settings.

#### **Privileged Access Management**

To maintain a manageable database size, older event data is purged at regular intervals. The intervals for the purging of privileged access management event data can be configured here.

Purge Windows events older than	Purges the information sent by the protection agents. The default value is 90 days.
Purge Endpoint Privilege Management events older than	Sets the number of days to keep Endpoint Privilege Management's unprocessed event data. The default is 30 days.
Purge Privilege Management for Unix & Linux events older than	Sets the number of days to keep events sent by Privilege Management for Unix & Linux Servers.
Purge file integrity events older than	Sets the number of days to keep File Integrity events captured by Endpoint Privilege Management.
Purge Endpoint Privilege Management Session Monitor events older than	Sets the number of days to keep the events collected when session monitoring is being used.
Purge Identity Services events older than	Sets the number of days to keep Identity Services unprocessed event data.

Click Update Privileged Access Management Maintenance Options to save your option settings.

#### Asset Maintenance

To maintain a manageable database size, the unprocessed data is purged at regular intervals. The intervals for the purging of asset data can be configured here.

Purge assets	When enabled, <b>Purge assets older than</b> sets the number of days to keep asset data for assets that were discovered once, but are never discovered again. Recommended: <b>30 days</b> .
Purge asset attributes	When enabled, <b>Purge asset attributes older than</b> sets the number of days to keep asset attribute data, such as ports, services, hardware, and attack events. Recommended: <b>7 days</b> .
Purge Cloud assets	When enabled, <b>Purge Cloud assets older than</b> sets the number of days to keep cloud asset data. Cloud asset purging does not run unless <b>Purge Assets</b> is also enabled. The <b>Purge cloud assets</b> <b>older than</b> setting must always be equal to or less than the <b>Purge assets older than</b> setting. Recommended: <b>30 days</b> .

Click Update Asset Maintenance Options to save your option settings.

#### **Application Maintenance**

To maintain a manageable database size, the unprocessed data is purged at regular intervals. The intervals for the purging of application data can be configured here.

Purge reports older than	Sets the number of days to keep report files that are stored on the file system and corresponding database. The default value is <b>90 days</b> .
Purge application user audits older than	Sets the number of days to keep user application audit data. Audit data is the record of user activities in the BeyondInsight system. Recommended: <b>120 days</b> .
Purge closed tickets older than	Sets the number of days before closed or inactive tickets are deleted. The calculation for purging ensures the ticket is closed and uses the date the ticket was last updated, not the due date.
	For example, a ticket has a due date 60 days in the future but the ticket was closed and not edited for over a week. If the purge setting is set to <b>7</b> , then the ticket is purged even though the due date is in the future.

Click Update Application Maintenance Options to save your option settings.

#### **Third-Party Integration Maintenance**

To maintain a manageable database size, the temporary data is purged at regular intervals. The interval for the purging of **Third Party Integration** temporary data can be configured here.

Purge third-party uploads older	Sets the number of days to keep the information about the scan files that you upload.
than	The default is <b>90 days</b> .

Note: The data in the scan file is not purged.

Click Update Third-Party Integration Maintenance Options to save your option settings.

#### **Purging Options**

In addition to purging data according to the data retention settings, the nightly purge can be configured with these advanced options. Go to **Configuration > Support > Purging Options** to set the following advanced options:

- **Database Index Maintenance:** (Disabled by default) When you enable this option, you can choose how frequently you want to purge the index, set the maximum time for the purge to execute in minutes, and set the maximum number of indexes to purge.
- **Nightly Database Statistics Maintenance:** (Enabled by default) This option purges database statistics each night.
- **Batch Purging:** (Disabled by default) Enable this option to purge multiple assets at one time in a batch. When this option is enabled, the complete asset, including all asset attributes is purged (all older data is removed from the asset). When this option is disabled, one asset is purged at a time, as opposed to a batch of assets.
- Loop Based Purging: (Disabled by default) When this option is enabled, after a round of purging is complete, the purge window is checked and if still in the purge window AND there are more than 1000 items left to purge, another round of purging begins. This looping cycle repeats until the purge window expires or there is not enough data worth deleting. The default purge window begins at 1:00 AM and is two hours long. When this option is disabled, only one round of purging is performed each day.

MENU	BeyondInsight Configuration
<b>n</b>	Advanced Purge Options

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

# BeyondTrust

## **Configure Proxy Settings**

You can configure a proxy server if your BeyondInsight server does not have direct internet access.

- 1. In the BeyondInsight Console, select Configuration.
- 2. Under System, select Proxy Settings.
- 3. Click the toggle to Enable proxy support.
- 4. Enter the IP address (including the prefix http://) or the FQDN (for example, somehost.example.com) of the proxy server, username, and password for the proxy server.

Note: The HTTPS protocol is not supported for the IP address or the fully qualified domain name.

- 5. Click the toggle to override any local proxies.
- 6. Click Update Proxy Settings.

#### **Configure Discovery Management Options**

#### **Set Job Refresh Options**

You can set a refresh interval, which changes job refresh logic to avoid polling third party credentials. Instead, the jobs refresh a number of minutes before scan. You can set refresh intervals for scan jobs and Smart Rules. Scans can run more efficiently when Smart Rules are set to refresh at longer intervals.

- 1. Select Configuration > Discovery Management > Options.
- 2. Under Job Refresh, set the following options:
  - **Maximum job refresh frequency:** BeyondInsight jobs are refreshed at the interval set. When the refresh occurs, updates to schedules, scanners, and Smart Rules are updated for the job. The default value is **360** minutes.
  - **Time to refresh before scan for third party credentials:** Sets a refresh interval which changes job refresh logic to avoid polling third party credentials. Instead, the jobs will refresh a number of minutes before scan.

depository institution. It is not authorized to accept deposits or trust accounts and is not licensed or regulated by any state or federal banking authority.

#### **Set Scan and Event Processing Options**

Go to **Configuration > Support > Processing Options** to set the number of threads for scan and event processing. The following options are available:

- Scan Threads: The number of scans that can be processed at one time. The default is 16.
- Asset Threads: The number of assets per scan that can be processed at one time. The default is **1**.
- Agent Event Threads: These are threads used for Discovery Scan data processing.
- Interleave Purging: When set to yes, uses idle threads to work on purging assets one at a time, if there are any assets queued up to be purged. If set to no (default), all purging activity is restricted to the dedicated purge window.
- **Importer seconds**: The number of seconds between each attempt to purge; only applies if **Interleave Purging** is set to **yes**.

Click Update Settings when done.

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

#### **Configure Global Site Options**

You can configure global website settings from the Configuration > System > Site Options page, including:

- · Changing the Login page to include lists of domains and LDAP servers
- · Displaying the Forgot Password link on the Login page
- Displaying social media links on the Login and About pages
- Changing the refresh interval for Smart Rules
- · Configuring a pre-login banner to appear to users before logging into the site
- · Configuring session options
- · Enabling and disabling Endpoint Privilege Management options
- Enforcing certificate validation during communication for LDAPS managed account tasks and LDAPS / AD user authentication and directory queries
- Turning on language selection
- Enabling and disabling the requirement to provide an access key when creating, editing, or using discovery scan credentials.
- · Creating a global access key to be used for all discovery scan credentials

#### List Domains and LDAP Servers on the Login Page

Users can log in to the management console using Active Directory or LDAP credentials. When this site setting is enabled, the user can select a domain or LDAP server from the **Log in to** list. Domain and LDAP server information is based on the Active Directory and LDAP user group information.

**Note:** The **Log** *in* **to** list is only displayed on the **Login** page when there are either Active Directory or LDAP user groups created in the management console.

*Tip:* By default, the setting is enabled. If you do not want to display domains or LDAP severs on the **Login** page, disable the setting.

- 1. Under Login Page, click the toggle to disable Show list of domains/LDAP servers on login page.
- 2. Click Update Login Page Options.

You must log out and log back in for the change to take effect.

#### **Display Forgot Password Link**

Users logging into the console using Active Directory credentials cannot use the **Forgot Password** feature. In this scenario, you can disable the setting so the link is no longer displayed on the **Login** page.

- 1. Under Login Page, click the toggle to disable Show Forgot Password link on login page.
- 2. Click Update Login Page Options.

You must log out and log back in for the change to take effect.

#### **Display Social Media links on the Login and About pages**

By default, links for Facebook, Twitter, LinkedIn, and YouTube are available at the bottom of the Login page and also on the About page.

- 1. Under Login Page, click the toggle to turn off Show social media links on login and about pages.
- 2. Click Update Login Page Options.

You must log out and log back in for the change to take effect.

#### **Change the Refresh Interval for Smart Rules**

Scans can run more efficiently when Smart Rules are set to refresh at longer intervals.

- 1. Under General, set the number of minutes for Maximum Smart Rule refresh frequency for asset updates. The default is 60.
- 2. Click Update General Options.

#### **Configure a Pre-Login Banner**

You can configure a banner to appear to all users upon access to the site.

- 1. Under Pre-Login Banner, click the toggle to enable the Show Banner.
- 2. Provide a title and message, and then click Update Pre-login Banner Options.

#### **Configure Session Options**

You can configure the following session related options:

- · Notification time before session timeout
- · Minimum interval between session extension requests
- User Quarantine Cache refresh interval

**Note:** The default session timeout period is 20 minutes, as specified in the configuration tool. If you wish to lower the session timeout period, please contact BeyondTrust Technical Support

- 1. Under Session, set the following:
  - Notification time before session timeout: Sets the amount of time, prior to the session timing out due to inactivity, that the system notifies the user that their session will timeout shortly.
  - **Minimum interval between session extension requests:** Sets the number of minutes that pass between session extension requests. In general, this setting should always be set low and should always be less than the session timeout value. The only time you should change this from the default of three minutes is if there are a severely high number of simultaneous users and session refresh requests to the server causing high loads.
  - User Quarantine Cache refresh interval: Account Quarantine is a feature that can be set at the user account level that prevents a user from logging on the console or API and also terminates any active sessions immediately. It is a preventative measure taken when suspicious activity is detected. The User Quarantine Cache refresh interval sets the number of seconds that pass before the database is updated with the most recently discovered user accounts from the

depository institution. It is not authorized to accept deposits or trust accounts and is not licensed or regulated by any state or federal banking authority.

quarantine cache. The quarantine is only applied to the user account after the database is updated. The user can remain logged on and sessions remain active up until the refresh interval time passes, and the database is updated with a **Quarantine** status. The default value is **600** seconds. The maximum value is **1200** seconds.

2. Click Update Session Options.

#### **Enable Language Selection (Localization)**

The management console can be viewed in the following languages:

- German
- English (US)
- Spanish (LA)
- French (FR)
- French (CA)
- Korean
- Japanese
- Portuguese (BR)

By default, the **Language** list is not displayed in the BeyondInsight console. Once localization is enabled, the **Language** list may be accessed from the **Profile and preferences** icon in the top right corner of the console and also from the bottom of the **Login** page.

- 1. Under Localization, click the toggle to enable the Show language picker option.
- 2. Click Update Localization Options.

You must log out and log back in for the change to take effect.

#### **Enable Endpoint Privilege Management Options**

Endpoint Privilege Management options are not enabled by default. You can enable the following options:

- · Include arguments when creating rules
- · Suppress events where rule has been applied
- Automatically retrieve initial grid data

#### **Enable Certificate Validation**

Certificate validation helps enforce the validity of a given certificate during communication. You can enforce the validation for LDAPS managed account tasks and LDAPS / AD user authentication and directory queries. Turning these options on will mean that valid certificates are required and Certificate Authorities must be installed on the server.

#### **Configure Global Discovery Credential Access Keys**

When the **Require a Discovery Credential Key** option is enabled, all discovery credentials require the global credential access key. Enable the option, and then enter a **Global Credential Key**.

## BeyondTrust

Note: You may still set a custom key on individual credentials to something other than the default.

When the **Require a Discovery Credential Key** option is disabled, all discovery credentials do not require an access key and all previously configured credential keys (including custom keys) are deleted.

Note: These settings apply to ALL discovery credentials for ALL tenants.

## **BeyondInsight Clarity Analytics**

BeyondInsight Clarity is a behavior analytics tool that examines and classifies events and activities to identify outliers or anomalies. An outlier is an observation which deviates so much from the other observations that it arouses suspicion. Clarity ranks activities and classifies assets according to their deviation from normal activity. The normal activity or baseline is formed from:

- History of past activities
- Risk attributes of an observed activity

Each activity or event has several key characteristics. When an observed characteristic goes beyond normal, an alert is issued. More flagged alerts indicates higher level of abnormality and threat level. The numeric threat level is the sum of all flagged alerts. In addition, all assets are grouped into clusters by similarity, taking into account all available information including vulnerabilities, attacks, installed applications, services, open ports, running applications, etc.

As a result, the behavior analytics:

- Assigns a threat level to each event from BeyondTrust Discovery Scanner, Endpoint Privilege Management, Privilege Management for Unix & Linux, and Password Safe.
- · Assigns cluster ID to all assets.

You can use Clarity to analyze data from the following sources:

- Endpoint Privilege Management
- Privilege Management for Unix & Linux
- BeyondTrust Discovery Scanner
- Password Safe
- · Third-party imports

## **Configure Clarity Analytics**

To work with BeyondInsight Clarity, you must configure settings in the BeyondInsight management console.

**Note:** Malware and attack vulnerability risk detection features have been deprecated in BeyondInsight and no longer function. Options relating to malware and attack risk data are being removed in a future release.

#### **Configure the Analytics Calculation**

- 1. In the console, click Configuration.
- 2. Under Analytics & Reporting, click Clarity Analytics.

- 3. From the Analytics Calculation section, you can:
  - Toggle Enable Analytics to turn on the feature.
  - · Select the hours and minutes for Time to run at.
  - · Select the frequency for running analysis.
  - Set the Alert Threshold for flagging explicit alerts. The • higher the value, the higher the sensitivity and the fewer flagged alerts. The range is from 0 to 1. The default value is 0.65.
  - Set the Som Probablity Threshold for flagging pattern alerts. The lower the value, the higher the sensitivity and the fewer flagged alerts. The range is from 0 to 1. The default value is 0.05.
  - Enter an email address to send notifications to. •
  - Set the notification subject.
- 4. Click Update Analytics Calculation Options.

#### Set Alert Trigger Weighing

From the Alert Trigger Weighing section, you can configure Clarity to

prioritize or weigh specific alerts. If an alert with a higher weight is triggered,

the alert appears more prominently in the Clarity analysis. This allows you to quickly see and react to critical alerts.

To configure a weight for an alert, click the minus and plus buttons to modify its numeric value, ranging from 0 to 10. When you are satisfied with your selections, click Update Alert Triggering Weighing Options to finalize.

#### **Configure Risk Analytics**

Using the risk analytics values, you can focus the results data on the highest risk assets.

Enabling Normalize scales all values between 0 and 10. When you choose to normalize the data, the asset at the highest risk is assigned the highest rating. All other assets are rated and organized below the highest risk asset. Normalizing the results provides a way to distribute the assets in a more meaningful way to analyze the data.

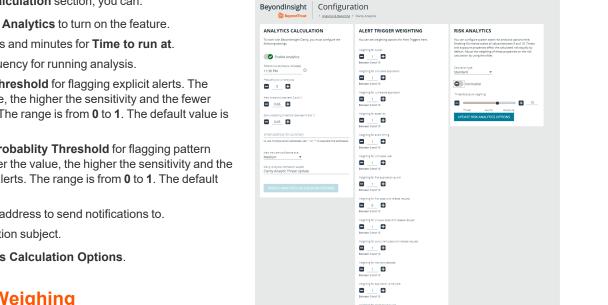

Threat and exposure properties affect the calculated risk equally by default. Adjust the weighting of these properties on the risk calculation by using the slider. You can change the results to emphasize risk levels based on exposures or threats. For example, if you move the slider to Exposure, asset exposure risk factors are given greater weighting in the final risk calculation and increase an asset's risk score.

## **Clarity Reports**

The following reports are available to run against Clarity data:

- Event Review Endpoint Privilege Management: Breakdown of alert triggers for events by threat level. Includes relevant event details, and is ordered by threat level from largest to smallest.
- Event Review Password Safe Release Events: Breakdown of alert triggers for Password Safe release events by threat level.
- Event Review Privilege Management for Unix & Linux Breakdown of alert triggers for Privilege Management for Unix & Linux events by threat level. Includes relevant event details, and is ordered by threat level from largest to smallest.

## **Use the Clarity Dashboard**

The Clarity Dashboard analyzes information stored in BeyondInsight's centralized database, which contains data gathered from across any or all BeyondInsight supported solutions deployed in the customer environment. These include:

- Endpoint Privilege Management
- Privilege Management for Unix & Linux
- BeyondTrust Discovery Scanner

#### **Triggers**

The **Triggers** list displays the total number of events which are affected by each trigger. The following triggers identify assets that are at risk.

**Note:** Malware and attack vulnerability risk detection features have been deprecated in BeyondInsight and no longer function. Options relating to malware and attack risk data are being removed in a future release.

Trigger	Description
	Triggers when potentially untrusted users log into Administrator or local accounts. Can be triggered by events in the following products:
Untrusted User	Endpoint Privilege Management
	Privilege Management for Unix & Linux
	BeyondTrustDiscovery Scanner
	Password Safe events
First Password Request	<ul> <li>User requests password for a managed account and system they have never requested before</li> </ul>
	Triggers when an event is determined to be an outlier based on Clarity analysis. Can be triggered by events in the following products:
	Endpoint Privilege Management
Outlier	Privilege Management for Unix & Linux
	Password Safe
	BeyondTrust Discovery Scanner
	Password Safe events
Unusual Password Release Request	<ul> <li>User does not retrieve the password for approved request or the password is retrieved more than once</li> </ul>
Concurrent Password Release	Password Safe events
Request	Triggers if a user requests more than one password at the same time.
Untrusted Application	Endpoint Privilege Management events.

SALES: www.beyondtrust.com/contact SUPPORT: www.beyondtrust.com/support DOCUMENTATION: www.beyondtrust.com/docs

	Triggers when unsigned and un-versioned applications are found on system.
	Triggers when an application is launched for the first time. Can be triggered by events in the following products:
First Application Launch	Endpoint Privilege Management
	Privilege Management for Unix & Linux
	User launches an application they have never launched before

If a trigger has events, you can click the trigger to view the risk events that make up the count.

#### **Risk Events by Threat Level**

Drill into the risk events to learn more about the event, such as the trigger, type of event, or severity. Use the **Tab** key to navigate through the areas on the page and to view the metrics on the bubbles.

#### **View Cluster Maps**

**Note:** This feature is deprecated for new installations of BeyondInsight 22.1 and future releases. Cluster Maps and Cluster Analysis are available only for BeyondInsight releases prior to 22.1 and if upgrading to 22.1 from previous releases.

A cluster map is a visual representation of the following cluster types.

- Asset Cluster: Larger clusters indicate more assets sharing similar traits within an organization. Smaller clusters indicate a potential anomaly. Clusters groups include:
  - Launched applications
  - Vulnerabilities
  - Attacks
- User Cluster: Represents Password Safe users that share similar characteristics in an organization.

#### **Cluster Map Numbering**

A cluster map number is randomly generated and does not have any meaning in the context of the actual data. However, the closer the cluster map numbers, the more similar the attributes of the assets to each other.

For example, assets assigned to cluster 14 and cluster 16 would have similar qualities. However, assets assigned to cluster 14 and cluster 68 would have fewer qualities in common.

The cluster map numbers can change at any time, but this does not reflect on the assets or any potential anomalies that might exist.

#### **Cluster Shading**

#### Asset

Shading is based on the **Asset Risk**, **Attacks**, **Vulnerability** app value. The Cluster Map uses the highest of the three, and the gradient is based on a range from 0.0 to 1.0.

#### User

Shading is based on the User Risk attribute for Password Safe users.

#### **Asset Cluster Attributes**

There are eight cluster attributes organized in the following categories:

- Ordering attributes: Attributes are ordered from low to high.
- **Pattern attributes:** A pattern value maps a set of characteristics to a single value (in the range 0 1). The difference in pattern values shows similarities between different sets of the same type characteristics.

Attribute	Туре	Description
Attacks	Ordering	Number of detected attacks. Greater value means more detected attacks.
Vulnerable Apps	Ordering	Number of launches of vulnerable applications. Greater value means more started/running vulnerable applications.
Risk	Ordering	Asset risk. Greater value means greater risk.
App Set	Ordering	Running or/and elevated (depends on Privilege Management for Windows Servers) applications.
Vulnerabilities Set	Pattern	Discovered vulnerabilities.
Service Set	Pattern	Services
Software Set	Pattern	Installed software packages.
Port Set	Pattern	Opened ports.

#### **User Cluster Attributes**

Attribute	Туре	Description
SharedSysAssetRisk	Ordering	Number of blocked commands in a Password Safe session, corresponds to block, block+lock, lock, and terminate command triggers.
SharedSysDenied	Ordering	Number of denied session requests.
SharedUsrRisk	Ordering	Maximum risk on an access policy associated with the user.
SharedSysSet	Pattern	Machines a user can access.
SharedSysVulnSet	Pattern	Vulnerabilities for machines a user can access.
SharedSysSrvSet	Pattern	Services for machines a user can access.
SharedSysSoftSet	Pattern	Software installed for machines a user can access.
SharedSysPortSet	Pattern	Ports for machines a user can access.

#### **Analyze Cluster Maps**

You must configure settings in BeyondInsight before any data is collected.

The following procedure shows examples from asset clusters. The procedure and analysis is similar for user clusters.

- 1. From the menu, select Cluster Analysis. By default, the Cluster Map tab is selected.
- 2. Select one of the following tabs to analyze cluster map data:
  - Asset Counts: Clusters the assets with similar characteristics. The smaller the cluster tile, the more likely there is an outlier.
  - Cluster Risk: Clusters the assets based on the common risk characteristics. The larger tiles in the cluster map have the greater risk.
  - Attacks: Clusters assets based on the common attack properties. The larger tiles indicate a greater attack level. Drill down to learn more about the assets and the attack data.
  - Vulnerable Apps: Clusters the assets by the similar installed vulnerable applications. The larger tiles indicate a greater threat as a result of installed vulnerable applications on the assets.
- 3. Hover over the tile to display a summary of the event data.
- 4. Double-click a cluster to view more detail, and click the tabs to view more information.

# BeyondTrust

#### **Analyze Cluster Grids**

Some key tips to keep in mind when analyzing threat conditions in your Clarity results data:

- Sort clusters by ordering attributes, such as Vulnerable Apps, Attacks, or Risk.
- Potential outliers could be clusters with a small number of members and greater ordering attributes.
- For outliers, review the pattern attributes to identify if the outliers have a unique or a different set of running applications, vulnerabilities, services, software, or ports.

To view the cluster grid, follow the steps.

- 1. From the menu, select Cluster Analysis.
- 2. Click the **Grid View** icon.
- 3. To review asset details for a cluster, double-click the row.

## Alerts in BeyondInsight Clarity Analytics

There are two types of alerts:

- Pattern: Determined by correlation of all characteristics of an event.
- Explicit: Determined by selected specific characteristics.

Alert	Туре	Description
a1	pattern	Maps all characteristics of an event into a single internal cluster using self-organizing maps clustering. Similar event characteristics lead to the same cluster. Thus, clusters with high share of mapped events represent typical behavior, while clusters with small number of events indicate outliers. Each user, host, or asset's characteristics are tracked independently with independent sets of clusters.
		<b>Note:</b> Clusters are hidden and are used only for analysis. They do not behave the same as asset clusters.
		Used characteristics:
		<ul> <li>Endpoint Privilege Management events, per user: EventType, Exercised privilege, Path, Asset, Launch weekday and time</li> </ul>
		<ul> <li>Privilege Management for Unix &amp; Linux events, per RunHost: RunCommand, RunCWD, PBLUUser, Policy Server, SubmitHost, FinishStatus, Launch weekday and time, Accept, RiskLevel</li> </ul>
		Vulnerability events, per Asset: Vulnerability type, Risk
		Attack events, per Asset: Attack type, Category
a2 explicit		Untrusted Application
		Default value: 0.33
		• If the application is unsigned, then value = value + 0.33
		<ul> <li>If application has no version information, then value = value + 0.33</li> </ul>
a5	explicit	Event Timing
		Event time within working hours and weekday
		Default value: 0.33
		<ul> <li>If EventTime &lt; WorkingHoursStart or EventTime &gt; WorkingHoursEnd, then value = value + 0.33</li> </ul>
		<ul> <li>If EventDay is in WorkingWeekDaysMask, then value = value + 0.33</li> </ul>
a6	explicit	Untrusted User
		Default value: 0.33
		• If user is local (not domain) user, then value = value + 0.33
		• If user is administrator, then value = value + 0.33
а7	explicit	First App Launch
		The alert is flagged when a user launches an application they have never launched before.

Alert	Туре	Description			
a8	explicit	First request for given managed account and system (Password Safe).			
		The alert is flagged when a user request password for account and system have never requested before.			
a9	explicit	Unusual password releases (Password Safe)			
		The alert is flagged when a user does not retrieve the password for approved request or the password is retrieved more than once.			
a10	explicit	Concurrent password requests (Password Safe).			
		The alert is flagged when a user tries to acquire more than one password at a time.			

# Configure a Claims-Aware Website to Authenticate against SAML

You can configure a claims-aware website to bypass the current BeyondInsight login page and authenticate against any configured Federated Service that uses SAML to issue claims.

The claims-aware website is configured to redirect to a defined Federation Service through the **web.config**. Upon receiving the required set of claims, the user is redirected to the existing BeyondInsight website. At that point, it is determined if the user has the appropriate group membership to log in, given the claims associated with them.

If users attempting to access BeyondInsight have group claims matching a group defined in BeyondInsight, and the group has the **Full Control** permission to the **Management Console Access** feature, the user bypasses the BeyondInsight login screen. If the user is new to BeyondInsight, they are created in the system using the same claims information. The user is also added to all groups they are not already a member of that match in BeyondInsight, and as defined in the group claim information.

If the user is not a member of at least one group defined in BeyondInsight or that group does not have the **Full Control** permission to the **Management Console Access** feature, they are redirected to the BeyondInsight login page.

#### Create a BeyondInsight Group

Create a BeyondInsight group and ensure the group is assigned the **Full Control** permission to the **Management Console Access** feature.

## Add Relying Party Trust

After BeyondInsight is installed, metadata is created for the claims-aware website. Use the metadata to configure the relying party trust on the Federation Services instance.

The metadata is located in the following directory:

<Install path>\eEye Digital Security\Retina CS\WebSiteClaimsAware\FederationMetadata\2007-06\

When selecting a **Data Source** in the **Add Relying Party Trust** Wizard, select the **FederationMetadata.xml** generated during the install.

<b>Q</b>	Add Relying Party Trust Wizard				
Select Data Source					
Steps	Select an option that this wizard will use to obtain data about this relying party:				
Welcome	Import data about the relying party published online or on a local network				
Select Data Source	Use this option to import the necessary data and certificates from a relying party organization that publishes				
Configure Multifactor Authentication Now?	its federation metadata online or on a local network.				
Choose Issuance Authorization Rules	Federation metadata address (host name or URL):				
Ready to Add Trust	Example: fs.contoso.com or https://www.contoso.com/app				
e Finish	Import data about the relying party from a file     Use this option to import the necessary data and certificates from a relying party organization that has     exported is federation metadata to a file. Ensure that this file is from a trusted source. This wizard will not     validate the source of the file.     Federation metadata file location:				
	Browse      Erter data about the relying party manually Use this option to manually input the necessary data about this relying party organization.				

<sup>©2003-2022</sup> BeyondTrust Corporation. All Rights Reserved. Other trademarks identified on this page are owned by their respective owners. BeyondTrust is not a chartered bank or trust company, or TC: 12/1/2 depository institution. It is not authorized to accept deposits or trust accounts and is not licensed or regulated by any state or federal banking authority.

## Set Up Claim Rules

**Note:** Claims rules can be defined in a number of different ways. The example provided is simply one way of pushing claims to BeyondInsight. As long as the claims rules are configured to include at least one claim of outgoing type **Group** (with **Group** claim matching exactly what is in BeyondInsight) and a single outgoing claim of type **Name**, then BeyondInsight has enough information to potentially grant access to the site to the user.

Edit Rule - B	ILogonGroupMembership1
	ased on a user's Active Directory group membership. Specify the figure outgoing claim type and value to issue.
- BILogonGroupMembership1	
Rule template: Send Group Membership as a User's group:	Claim
ADFS\BILogonGroup	Browse
Outgoing claim type:	
Group	~
Outgoing name ID format:	
Unspecified	~
Outgoing claim value:	
AD FS Users	

#### **Supported Federation Service Claim Types**

Outgoing Claim Type	Outgoing Claim Type	Mapping to BeyondInsight User Detail
http://schemas.xmlsoap.org/claims/Group	Required	Group membership
http://schemas.xmlsoap.org/ws/2005/05/identity/claims/name	Required	User name
http://schemas.xmlsoap.org/ws/2005/05/identity/claims/surname	Optional	Surname
http://schemas.xmlsoap.org/ws/2005/05/identity/claims/givenname	Optional	First name
http://schemas.xmlsoap.org/ws/2005/05/identity/claims/emailaddress	Optional	Email address

## **Claims-Aware SAML**

The following procedure demonstrates how to set up a claims-aware website using the Windows Identity Foundation (WIF) SDK.

- 1. Start the Windows Identity Foundation Federation Utility.
- 2. On the **Welcome** page, browse to and select the **web.config** file for **BeyondInsight Claims Aware** site. The application URI automatically populates.
- 3. Click Next.
- 4. Select Using an existing STS.
- 5. Enter Root URL of Claims Issuer or STS .
- 6. Select Test location. FederationMetadata.xml is downloaded.
- 7. Click Next.
- 8. Select a STS signing certificate option, and then click Next.
- 9. Select an encryption option, and then click Next.

STS. Specify the WS-Federation metadata do		issued by an existing
TS WS-Federation metadata document location	n	
	Browse	Test location
ttps://adfsaccount.adatum.com	Browse	lest location
Example: https://fabrikam.com/EederationMet	adata/2007-06/FederationMetadata.xml)	

136

- 10. Select the appropriate claims, and then click Next.
- 11. Review the settings on the Summary page, and then click Finish.

## **Disable Forms Login**

In environments where SAML, smart card, or claims-aware is configured, we recommend enabling the **Disable Forms Login** authentication option to disallow users from using the standard login form in BeyondInsight.

To disable forms login for existing users, enable this option directly on a user account as follows:

- 1. Click the vertical ellipsis for the user account, and then click Edit User Details.
- 2. Under Authentication Options, toggle Disable Forms Login to enable the option.

Note: Please contact support for assistance if you need to bulkapply this setting to existing accounts.

# BeyondTrust

To configure login forms to automatically be disabled for newly created users:

- 1. Navigate to Configuration > Authentication Management > Authentication Options.
- 2. Under **Forms Login Options**, enable one or both options as applicable:
  - Disable Forms Login for new directory accounts
  - Disable Forms Login for new local accounts

# FORMS LOGIN OPTIONS Disable Forms Login should only be used in environments where SAML, Smart Card or Claims-aware is configured. Turning this option on will disallow users from using the standard login form BeyondInsight. Image: Constraint of the standard login form using the standard login form and the standard login fo

## Manage Endpoint Privilege Management Events

You can view Endpoint Privilege Management events on the Endpoint Privilege Management Events page.

Note: This feature is available only when an Endpoint Privilege Management license is detected.

## **View Events**

You can view and download all events for monitored systems and you can select an event to view more details about that specific event.

- 1. From the left menu in the BeyondInsight Console, click Endpoint Privilege Management.
- 2. By default, displayed events are filtered by the **Discovery Scanners** Smart Group. Select a Smart Group from the **Smart Group** filter to view events for that Smart Group.
- 3. To further filter the displayed events, use the Create Date filter, or Filter by criteria.
- 4. For additional details about an event, click the vertical ellipsis for the event, and then select **View Details**.

- 5. A window opens displaying details related to Endpoint Privilege Management, the rule, and the application.
- 6. Click the **Download All** button above the grid to download the events to a CSV file.

**Note:** Depending on the configuration of your grid and selected columns, not all event details may be visible. To configure display preferences, and see other options for the grid display, please see "Change and Set the Console Display Preferences" on page 16.

#### **Create Exclusion or Generate Rule from Event**

To create an exclusion or generate a rule from an event:

- 1. Click the vertical ellipsis for the event.
- Select the appropriate exclusion or rule type to generate.

**Note:** Exclusions can also be created from the **Exclusions** page. For more information, please see "Exclude Endpoint Privilege Management Events" on page 141.

#### **Endpoint Privilege Management Account Rotation**

			1
	•	ć	7
	7	٩	
1	r.,		

**Note:** Although the current release supports it, this functionality requires an upcoming release of EPM.

The client certificate needed to configure EPM can be downloaded from the Password Safe Cloud web console. BeyondInsight configuration segments can be included in the EPM policy to enable policy management from one console and password policy from Password Safe Cloud.

The integration between Password Safe and Endpoint Privilege Management allows for agent-based local account rotation and privileged account retrieval to *run as* actions. This integration is enabled for cloud deployments of Password Safe and Privilege Management.

To download the client certificate, go to **Configuration > System > Downloads** and click **Download Client Certificate**.

#### **Exclude Endpoint Privilege Management Events**

You can create exclusions to prevent recording unnecessary endpoint events. You can create and manage exclusions for Endpoint Privilege Management on the Endpoint Privilege Management Exclusions page.

#### **Create an Endpoint Privilege Management Exclusion**

- 1. In the BeyondInsight Console, navigate to **Configuration > Privileged Desktop Management > Endpoint Privilege Management Exclusions**.
- 2. Click Create Exclusion + above the grid.
- 3. Select the Exclusion Type.
- 4. Enter the Exclusion Details.
- 5. Click Create Exclusion.

*Tip:* Exclusions can also be created from selected events on the *Events* page. For more information, please see "Manage Endpoint Privilege Management Events" on page 139.

#### Manage Exclusions

- Use the filters above the grid to filter the list of exclusions by the date they were created, as well as the exclusion details and type of exclusion.
- 2. To edit or delete an exclusion, click the vertical ellipsis for the exclusion, and then select **Edit Exclusion** or **Delete Exclusion**.

## Create and View Smart Rules for Endpoint Privilege Management Policy Users

You can manage user-based policies for Endpoint Privilege Management users with Smart Rules, and view the policy users with the assigned policies.

Note: This feature is only available when an Endpoint Privilege Management license is detected.

To deploy policies to users, you need to first create rules and policies in the Endpoint Privilege Management **Policy Editor**, and then you can log in to BeyondInsight to create applicable Smart Rules.

#### **Create a Smart Rule**

When a policy is deployed using a policy user-based Smart Rule, only the policy rules set in the **User Configuration Rule Management** section of the policy are processed by Endpoint Privilege Management clients that receive the policy. Policy deployment is controlled by the specifications in the Smart Rule.

A policy user-based Smart Rule can deploy policies to Windows Active Directory domain users and local users that are not part of a domain.

#### Create Policy User-Based Smart Rule

- 1. From the Home page in the BeyondInsight Console, click Configuration.
- 2. In the General pane, click Smart Rules.
- 3. Select Policy User from the dropdown for the Smart Rule type filter.
- Click Create Smart Rule +. A new window opens.

# BeyondTrust

- 5. Select Policy Users for the category.
- 6. Provide a Name and Description for the policy.
- 7. Select a **Reprocessing Limit** from the dropdown to set how often the Smart Rule runs.
- 8. In the **Selection Criteria** section, select and add your desired filters to add the Endpoint Privilege Management accounts.
  - To onboard local policy users, use the User Account Attribute filter after discovering users via scans. Then use their privilege attribute or their name for the Selection Criteria.
- 9. In the Actions section, select and add the following actions:
  - · Add Policy Users: Adds users to BeyondInsight.
  - **Deploy Endpoint Privilege Management Policy:** Deploys policies to the user accounts.
  - Mark each policy user for removal: Deletes the user accounts from the Smart Group.
  - Show as Group: Displays the Smart Rule as a Smart Group on the **Policies** page.
- 10. Click Create Smart Rule.

#### **View Policy Users**

After the Smart Rule processes, you can view policy users on the **Policy Users** page. This page shows the policies assigned and applied.

- 1. To view the page, click **Policy Users** on the **Home** page, or on the menu under **Endpoint Privilege Management**.
- 2. Displayed policy users are filtered by the selected **Smart Group filter**.
- 3. Displayed policy users can also be filtered by other criteria.
- 4. Displayed policy users can be downloaded, and the grid view can be modified.

**Note:** Depending the configuration of your grid and selected columns, not all policy user details may be visible. To configure display preferences, and see other options for the grid display, please see "Change and Set the Console Display Preferences" on page 16.

5. To remove a user from a policy, click the vertical ellipsis at the right end of the line and select Delete Policy User.

#### Manage Endpoint Privilege Management Policies

Using BeyondInsight you can deploy Endpoint Privilege Management polices to assets and policy users. From the **Endpoint Privilege Management Polices** page, you can view a list of available Endpoint Privilege Management policies, and in single-tenant environments only, you can manage the global priority for the policies. You can also delete policies if you have sufficient permissions.

**Note:** Endpoint Privilege Management features are only available when an Endpoint Privilege Management license is detected.

If the Endpoint Privilege Management Web Policy Editor (WPE) is installed in your BeyondInsight instance, and your account has sufficient permissions, you can view the details for each policy, unlock policies, edit policies (which also locks the policy), and delete policies.

**Note:** The WPE is not installed out of the box with BeyondInsight. Please contact your BeyondTrust representative for assistance with installing the WPE and its associated WPE service in your BeyondInsight environment.

#### **View Endpoint Privilege Management Policies**

- 1. From the left menu in BeyondInsight, select Policies under Endpoint Privilege Management.
- 2. To filter the list of displayed policies, select the desired criteria from the Filter by list above the grid. Available filter options are:
  - Policy Name
  - Locked
  - Locked By
  - Policy Version
  - Policy Workgroup
  - Powered by

**Note:** If you select **Filter by > Locked**, you can then select **Locked** or **Unlocked** as the filter criteria. If a policy is locked, this indicates that a user currently has it locked by a policy editor. The ability to lock, unlock, and edit policies within BeyondInsight is planned for a future release. If the WPE is installed in your BeyondInsight instance, and you have sufficient permissions, you can unlock a policy that is locked by another user, and then lock the policy so you can edit it.

*Tip:* You can see who added, modified, or deleted an Endpoint Privilege Management policy from the **Configuration > General > User Audits** page in BeyondInsight. Click the *i* button for a specific activity to view its details .

# BeyondTrust

For more information on using the Endpoint Privilege Management Web Policy Editor, please see:

- "Overview of Endpoint Privilege Management Web Policy Editor" on page 148
- "Create, View, and Edit Endpoint Privilege Management Policies" on page 153

## Deploy Endpoint Privilege Management Policies to Assets and Policy Users Using a Smart Rule

- 1. From the Smart Rules page in BeyondInsight, select Asset or Policy User from the Smart Rule type Filter dropdown, and then click Create Smart Rule.
- 2. Under Actions, select Deploy Endpoint Privilege Management Policy from the dropdown.
- 3. Click Select Policies for Deployment.

**Note:** We recommend setting policy priority using the global policy priority feature over setting policy priority within a Smart Rule. For more information on managing global priority for policies, please see, "Manage Global Priority for Endpoint Privilege Management Policies" on page 146.

For more information on working with Smart Rules to organize assets, please see "Use Smart Rules to Organize Assets" on page 68.

# Manage Global Priority for Endpoint Privilege Management Policies

If multiple Smart Rules contain the same asset and have different policy priorities set within each of those Smart Rules, the Endpoint Privilege Management agent does not know which policy has the top priority on that asset. In this case, a different policy can take precedence each time the agent processes the Smart Rules. To prevent this, we recommend setting a global priority for your polices. With global policy priority enabled, BeyondInsight processes all policy-configured Smart Rules and serves all policies across all applicable Smart Rules to the Endpoint Privilege Management agent as per the defined global priority order.

**Note:** The global policy priority feature is enabled by default on new installations of BeyondInsight 21.1 or later. It is not enabled by default when upgrading BeyondInsight versions prior to 21.1 to the 21.1 release or later releases.

**Note:** The global policy priority feature is supported only in single-tenant BeyondInsight installations. This feature is disabled in multi-organization environments.

Enable global policy priority as follows.

1. From the left menu in BeyondInsight, select Policies under Endpoint Privilege Management.

147

- 2. Click **Configure Global Priority Policy**, or if this is your first time using the global policy priority feature, click **Configure Now** in the banner that displays at the top of the page.
- Select the policies using the plus sign next to the policy and set their priorities using the arrows. Alternatively, you can manually specify the priority number in the box for the policy, and then click the plus sign.

**Note:** All policies must be prioritized in order to enable the **Use Global Priority** option. Also, any policies added to BeyondInsight after global policy priority is enabled, are not available for assignment within Smart Rules until a priority has been explicitly set for them here.

- 4. Click Save Priority.
- The banner at the top of the page now indicates a global policy priority has been configured. Click the toggle to enable the Use Global Priority option.
- 6. A confirmation message displays. Click **Enable Global Policy Priority** in the message box.
- 7. The banner at the top of the page now indicates global policy is enabled and Smart Rule prioritization is disabled, and the policies display in the grid with their assigned priority.

# **Overview of Endpoint Privilege Management Web Policy Editor**

The Endpoint Privilege Management Web Policy Editor (WPE), allows you to view, unlock, edit, and lock existing Endpoint Privilege Management policies, as well as create new policies directly from the BeyondInsight console, eliminating the need to use a standalone policy editor. Users with read-only permissions for the **Endpoint Privilege Management** feature can view policy information, while those with read/write permissions can create, view, unlock, edit, lock, and delete policies.

**Note:** Only policies powered by Defendpoint can be viewed, unlocked, edited, and locked. Policies powered by PowerBroker can only be deleted.

# **Policy Editor Components**

#### Workstyles

Workstyles are used to assign Application Rules for a specific user, or group of users.

\*

**Note:** The WPE in BeyondInsight supports integration with Azure Active Directory (AD). Filters can be used within Workstyles to query Azure AD groups and users. Only one Azure AD tenant per organization is supported. For this integration to work, you must create an Azure AD directory credential in BeyondInsight.

### **Application Groups**

Application Groups are used by Workstyles to group applications together to apply certain Privilege Management behavior.

### **Content Groups**

Content groups are used by Workstyles to group content together to apply certain Privilege Management behavior.

#### Messages

Messages are used by Workstyles to provide information to the end user when Privilege Management has applied certain behavior that you've defined and need to notify the end user.

#### Utilities

The WPE provides some useful tools to help with managing policies, including an import policy tool and a license management tool.

For more information on creating an Azure AD directory credential in BeyondInsight, please see "Create and Edit Directory Credentials" on page 19.

## Use the QuickStart for Windows or Mac Template

To get started quickly using the WPE, create a new policy using either the **QuickStart For Windows** template, or the **Quickstart For Mac** template.

The QuickStart templates for Windows and Mac policies contain Workstyles, Application Groups, Messages, and Custom Tokens configured with Privilege Management and Application Control. The QuickStart policy is designed from BeyondTrust's experiences of implementing the solution across thousands of customers, and is intended to balance security with user freedom. As every environment is different, we recommend you thoroughly test this configuration to ensure it complies with the requirements of your organization.

## **Customize the QuickStart Policy**

Before deploying the QuickStart policy to your users, you must make some company-specific customizations to the standard template.

At a minimum you must:

- Configure the users or groups that can authorize requests that trigger messages.
- Assign users and groups to the high, medium, and low flexibility Workstyles.
- Populate the Block Blocked Apps Application Group with any applications that you want to block for all users.
- Set your shared key so you can generate a Privilege Management Response code.

# **QuickStart Template Summary**

This section provides information about the properties for the Windows and Mac QuickStart templates, including the Workstyles and Application Groups that comprise the template.

## **WorkStyles**

#### **All Users**

This Workstyle contains a set of default rules that apply to all standard users regardless of the level of flexibility they need.

The All Users Workstyle contains rules to:

- Block any applications in the **Block Blocked Apps** group.
- Allow Privilege Management Support tools.
- Allow standard Windows and Mac functions, business applications, and applications installed through trusted deployment tools to run with admin rights.
- Allow approved standard user applications to run passively.

#### **High Flexibility**

This Workstyle is designed for users that require a lot of flexibility, such as developers.

The High Flexibility Workstyle contains rules to:

- Allow applications that are in the Add Admin High Flexibility group to run with admin rights.
- · Allow known business applications and operating system functions to run.

150

- Allow users to run signed applications with admin rights.
- Allow users to run unknown applications with admin rights once they confirm that the application should be elevated.
- · Allow unknown business application and operating system functions to run on demand.

#### **Medium Flexibility**

This Workstyle is designed for users that require some flexibility, such as sales engineers.

- Allow applications that are in the Add Admin Medium Flexibility group to run with admin rights.
- · Allow known business applications and operating system functions to run.
- Allow users to run signed applications with admin rights once they confirm that the application should be elevated.
- · Prompt users to provide a reason before they can run unknown applications with admin rights.
- Allow unknown business application and operating system functions to run on demand.
- Restricted OS functions that require admin rights are prevented and require support interaction.

#### Low Flexibility

This Workstyle is designed for users that don't require much flexibility, such as helpdesk operators.

- Allow applications that are in the Add Admin Low Flexibility group to run with admin rights.
- Prompt users to contact support if a trusted or untrusted application requests admin rights.
- Prompt users to contact support if an unknown application tries to run.
- Allow known approved business applications and operating system functions to run (Windows only).

#### Administrators

This Workstyle provides visibility on the Administrator accounts in use in the environment.

The Administrators Workstyle contains general rules to:

- · Capture user and host information.
- Block users from modifying local privileged group memberships.

## **Application Groups**

The Application Groups that are prefixed with (**Default**) or (**Recommended**) are hidden by default and do not need to be altered. Click the **Show Hidden** button above the grid to see all Application Groups.

- Add Admin All Users (Business Apps): Contains applications that are approved for elevation for all users, regardless of their flexibility level.
- Add Admin All Users (Windows Functions): Contains operating system functions that are approved for elevation for all users.
- Add Admin High Flexibility: Contains the applications that require admin rights that should only be provided to the high flexibility users.
- Add Admin Low Flexibility: Contains the applications that require admin rights that should only be provided to the low flexibility users.

- Add Admin Medium Flexibility: Contains the applications that require admin rights that should only be provided to the medium flexibility users.
- Block Blocked Apps: This group contains applications that are blocked for all users.
- Passive Allowed Functions & Apps: Contains trusted applications, tasks and scripts that should execute as a standard user.
- Passive High Business Apps: Contains trusted applications, that should execute as a high flexibility administrative user.
- Passive Low Business Apps: Contains trusted applications, that should execute as a low flexibility administrative user.
- Passive Medium Business Apps: Contains trusted applications, that should execute as medium flexibility administrative user.
- (Default) Any Application: Contains all application types and is used as a catch-all for unknown applications.
- (Default) Any Trusted & Signed UAC Prompt: Contains signed (trusted ownership) application types that request admin rights.
- (Default) Any UAC Prompt: Contains application types that request admin rights.
- (Default) Privilege Management Tools: This group is used to provide access to a BeyondTrust executable that collects Privilege Management for Windows troubleshooting information.
- (Default) Child Processes of TraceConfig.exe: Contains application types that request to run child processes of TraceConfig.exe.
- (Default) Signed UAC Prompt: Contains signed (trusted ownership) application types that request admin rights.
- (Default) Software Deployment Tool Installs: Contains applications that can be installed by deployment tools such as System Center Configuration Manager (SCCM).
- (Recommended) Restricted Functions: This group contains OS applications and consoles that are used for system administration and trigger UAC when they are executed.
- (Recommended) Restricted Functions (On Demand): This group contains OS applications and consoles that are used for system administration.
- (Default) Trusted Parent Processes: Contains trusted applications that request to run parent processes.

#### **Messages**

The following messages are created as part of the QuickStart policy and are used by some of the Application Rules:

- Allow Message (Authentication): Asks the user to provide a reason and enter their password before the application runs with admin rights.
- Allow Message (Select Reason): Asks the user to select a reason from a dropdown menu before the application runs with admin rights.
- Allow Message (Support Desk): Presents the user with a challenge code and asks them to obtain authorization from the support desk. Support can either provide a response code or a designated, authorized user can enter their login details to approve the request.
- Allow Message (Yes / No): Asks the user to confirm that they want to proceed to run an application with admin rights.
- Block Message: Warns the user that an application has been blocked.
- Block Notification: Notifies the user that an application has been blocked and submitted for analysis.
- Notification (Trusted): Notifies the user that an application has been trusted.

depository institution. It is not authorized to accept deposits or trust accounts and is not licensed or regulated by any state or federal banking authority.

## **Use the Server Role Template**

The Server Roles policy contains Workstyles, Application Groups, and Content Groups to manage different server roles such as DHCP, DNS, IIS, and print servers.

©2003-2022 Beyond Trust Corporation. All Rights Reserved. Other trademarks identified on this page are owned by their respective owners. Beyond Trust is not a chartered bank or trust company, or

# BeyondTrust

## **Server Roles Template Summary**

This template policy contains the following elements.

#### WorkStyles

- Server Role Active Directory Template
- Server Role DHCP Template
- Server Role DNS Template
- Server Role File Services Template
- Server Role Hyper V Template
- Server Role IIS Template
- Server Role Print Services Template
- Server Role Windows General Template

#### **Application Groups**

- Server Role Active Directory Server 2008R2
- Server Role DHCP Server 2008R2
- Server Role DNS Server 2008R2
- Server Role File Services Server 2008R2
- Server Role General Tasks Server 2008R2
- Server Role Hyper V Server 2008R2
- Server Role IIS Server 2008R2
- Server Role Print Services Server 2008R2

#### **Content Groups**

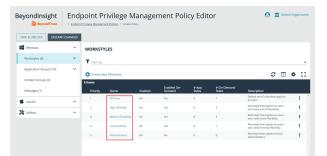

- AD Management
- Host Management
- IIS Management
- Printer Management
- Public Desktop

# Create, View, and Edit Endpoint Privilege Management Policies

# **Create a Policy**

- 1. From the left menu, select Policies under Endpoint Privilege Management.
- 2. Click Create Policy + above the grid.
- 3. Enter a name for the policy and select a Workgroup from the list.
- 4. Click Create Policy.
- 5. Select one of the following:
  - QuickStart for Windows: A preconfigured template with Workstyles, Application Groups, messages, and Custom Tokens already configured.
  - QuickStart for Mac: A preconfigured template with Workstyles, Application Groups, and messages already configured.
  - Server Roles: The Server Roles policy contains Workstyles, Application Groups, and Content Groups to manage different server roles such as DHCP, DNS, IIS, and print servers.
  - Blank: Select to configure a policy from scratch. There are no preconfigured settings in this template.

The Policy Editor opens to the **Workstyles** page. At this point you must configure the Workstyle, Application Groups, Application Rules and other policy configuration as required for your organization. The templates and their configuration components are described in more detail in the below sections.

**Tip:** For quick access to the **Workstyles Summary** page, click the hyperlink for the Workstyle name.

## **View a Policy**

- 1. From the left menu, select Policies under Endpoint Privilege Management.
- 2. Click the vertical ellipsis for the policy you wish to view, and then select **View Policy**.

# BeyondTrust

3. The Policy Editor opens in Read Only mode.

**Tip:** If you wish to edit the policy, click the **Policy List** link at the top of the page to go back to the main Policies page where you can select the policy to edit and lock it.

- 4. Use the options in the left navigation to view the following policy information:
  - For Windows policies:
    - Workstyles
    - Application Groups
    - Content Groups
    - Messages
  - For macOS policies:
    - Workstyles
    - Application Groups
    - Messages
  - Utilities:
    - Licenses
    - Import Policy
    - Template Policies

**Note:** You can also filter the contents displayed in each grid using the **Filter By** list above the grid.

# **Edit a Policy**

When you edit a policy, the policy is locked. Other policy administrators cannot access the policy to change the properties when the status is **Locked**. The policy is unlocked when changes are saved or discarded.

- 1. From the left menu, select Policies under Endpoint Privilege Management.
- 2. Click the vertical ellipsis for the policy you wish to edit.
- 3. If a policy is locked, the **Unlock Policy** action displays in the menu. Click to unlock the policy.
- 4. Select Edit and Lock Policy.

- 7. Once the policy is updated, click **Save and Unlock** to save a new revision of the policy, or **Discard Changes** to remove changes.
- 8. If Discard Changes is selected, you are prompted to Continue Editing or Discard Changes.
- 9. (Optional). On the **Save and Unlock** dialog box, you can enter **Annotation notes** about the policy changes. You can also check the **Auto Assign Policy to Groups?** box, to automatically assign the latest revision to groups the policy is currently assigned to.

**Note:** The **Auto Assign Policy to Groups?** option is only available when the groups are currently on the latest policy. If they are on an older version, only the **Annotation notes** option is displayed.

F Tip: You can export a policy and import a policy to overwrite the existing one while viewing a policy in read-only mode and while editing a policy in read/write mode. Select Utilities > Import Policy from the left navigation, click Overwrite Policy, and then click Export Existing Policy to export. Drop a file in the box to upload a new policy and then click Upload File.

i

For more information on editing the various components of a policy, including Workstyles, Application Rules, and Application Groups, please see "Use the Policy Editor to Manage Policy" in the <u>Privileged Management Cloud Administration Guide</u> at <u>https://www.beyondtrust.com/docs/privilege-management/documents/windows-mac/pmc/pm-cloud-admin.pdf</u>.

# **View Endpoint Privilege Management Agents**

Agents are assets with Endpoint Privilege Management installed. You can view and download Endpoint Privilege Management agents on the **Endpoint Privilege Management Agents** page.

Note: This feature is only available when an Endpoint Privilege Management license is detected.

## **View Agents**

- 1. In the BeyondInsight Console, click the MENU.
- 2. Under Endpoint Privilege Management, click Agents.

*Tip:* You can also access the *Endpoint Privilege Management Agents* page from the *Assets* page by clicking the *Endpoint Privilege Management* link at the top of the page.

- 3. By default, displayed agents are filtered by the **Discovery Scanners** Smart Group. Select a Smart Group from the **Smart Group** filter to view agents for that Smart Group.
- 4. To further filter the displayed agents, use the Last Updated filter, or Filter by criteria.
- 5. Click the **Download All** button above the grid to download the list of agents to a CSV file.

**Note:** Depending on the configuration of your grid and selected columns, not all agent details may be visible. To configure display preferences, and see other options for the grid display, please see "Change and Set the Console Display Preferences" on page 16.

# View Endpoint Privilege Management File Integrity Monitoring

You can view file integrity monitoring events using Endpoint Privilege Management.

## **View File Integrity Monitoring Events**

File integrity monitoring captures events related to created, edited, or deleted items in folders, according to the created rules.

- 1. In the BeyondInsight Console, click the MENU.
- 2. Under Endpoint Privilege Management, click File Integrity Monitoring.
- 3. By default, displayed events are filtered by the **Discovery Scanners** Smart Group. Select a Smart Group from the **Smart Group** filter to view events for that Smart Group.
- 4. To further filter the displayed events, use the Create Date filter, or Filter by criteria.
- 5. Click the **Download All** button above the grid to download the events to a CSV file.

Note: Grid Configuration is not available for this grid.

**Note:** Depending on the configuration of your grid and selected columns, not all file monitoring event details may be visible. To configure display preferences, and see other options for the grid display, please see "Change and Set the Console Display Preferences" on page 16.

<sup>©2003-2022</sup> BeyondTrust Corporation. All Rights Reserved. Other trademarks identified on this page are owned by their respective owners. # **Monitor Endpoint Privilege Management Sessions**

You can view session details and replay sessions using Endpoint Privilege Management.

Note: This feature is only available when an Endpoint Privilege Management license is detected.

### **View Session Details**

- 1. In the BeyondInsight Console, click the MENU.
- 2. Under Endpoint Privilege Management, click Session Monitoring.
- 3. By default, displayed sessions are filtered by the **Discovery Scanners** Smart Group. Select a Smart Group from the **Smart** Group filter to view sessions for that Smart Group.
- 4. To further filter the displayed sessions, use the Filter by criteria above the grid.
- 5. For additional details about a session, click the vertical ellipsis for the session, and then select View Details.
- 6. Click the Download All button above the grid to download the sessions to a CSV file.

Note: Depending on the configuration of your grid and selected columns, not all session details may be visible. To configure display preferences, and see other options for the grid display, please see "Change and Set the Console Display Preferences" on page 16.

# **Session Replay**

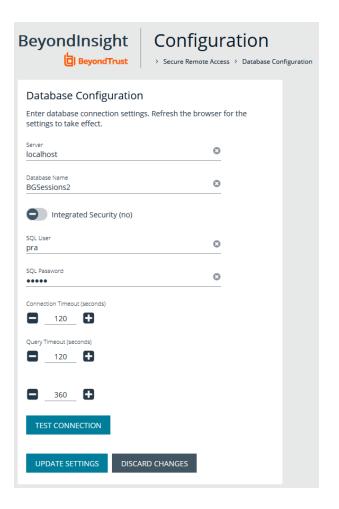

- 1. Follow the steps above to select a session.
- 3. A new page opens, showing some details of the session, a list of the **Events** and when they occurred (which can be searched), and a slideshow of the session.
- 4. Buttons under the slideshow control session playback. You can change the speed of session playback by selecting a different **Slideshow Delay**.
- 5. You can download an image of any session view by clicking the Snapshot button.

# **View Privileged Remote Access Data**

If you have a licensed instance of Privileged Remote Access configured in your environment, you can export session data to an export database. You can then review Privileged Remote Access session data in the BeyondInsight Console, using the Privileged Remote Access Dashboard.

# **Configure the Privileged Remote Access Database Connection**

- 1. In the BeyondInsight Console, select Configuration.
- 2. Under Secure Remote Access, select Database Configuration.
- 3. Provide the settings to connect to your Privileged Remote Access export database, and then click **Test Connection**.
- 4. Click Update Settings.

# View the Privileged Remote Access Dashboard

1. From the menu, select **Privileged Remote Access**.

depository institution. It is not authorized to accept deposits or trust accounts and is not licensed or regulated by any state or federal banking authority.

# Integrate the BeyondInsight API into Other Applications

You can integrate part of BeyondInsight's API into your applications using an API key.

Note: The API Registration page is only available to BeyondInsight administrators.

The ID and key are generated by BeyondInsight.

- 1. Select Configuration > General > API Registrations.
- 2. Enter a name for the registration.
- 3. Click Create New API Registration to create a new application registration.

BeyondInsight generates a unique identifier (API Key) that the calling application provides in the authorization header of the web request. The API Key is masked and can be shown in plain text by clicking the **Show Key** icon next to the **Key** field. The API Key can also be manually rotated, or changed, by clicking the circular arrow.

**Note:** Once the key has been changed, any script using the old key receives a "401 unauthorized" error until the new key is used in its place. Read access and rotation of the key are audited.

- 4. To configure a new registration or modify an existing one, select the registration, and then set the Authentication Rule Options.
  - Client Certificate Required: If enabled, a client certificate is required with the web request. If not, client certificates are
    ignored and do not need to be present. A valid client certificate is any client certificate signed by a certificate authority
    trusted by the server on which BeyondInsight resides.
  - User Password Required: If enabled, an additional authorization header value containing the RunAs user password is
    required with the web request. If not enabled, this header value does not need to be present and is ignored if provided.
    Square brackets surround the password in the header.

Authorization=PS-Auth key=c479a66f...c9484d; runas=doe-main\johndoe; pwd=[un1qu3];

- Verify PSRUN Signature: The PSRUN signature is an extra level of authentication. It is computed from the factors using a shared secret between the client and server. PSRUN sends the signature as part of the header during its API request. If enabled, the server recomputes the signature during factor validation and compares it against the one sent by the client. If the signatures match, the client's identity is considered verified. The signature effectively keeps the client in sync with the server. Changing the secret on the server requires the client to be rebuilt and guarantees that out-of-date clients cannot authenticate.
- On the Details page, click Add Authentication Rule to create authentication rules. At least one IP rule, PSRUN rule, valid source IP address (IPv4 or IPv6), IP range, or CIDR from which requests can be sent for this API Key is required. Enter one IP address, IP Range, or CIDR per line.

X-Forwarded-For rules can also be created by providing a valid source IP address (IPv4 or IPv6), an IP range, or CIDR. In a loadbalanced scenario, IP Authentication rules are used to validate the load balancer IP(s), and the X-Forwarded-For header is used to validate the originating client IP. Existing rules cannot be changed from an IP Rule to a X-Forwarded-For Rule or vice-versa. If an X-Forwarded-For rule is configured, it is required for the HTTP Request. If the X-Forwarded-For header is missing, the request fails with a 401 unauthorized error.

6. Click Create Rule.

# **Support and Product Updates**

Click **Menu** in the left navigation toolbar, then **About**, to access support information and tools, product updates, and other resources including documentation links, version details, and the maintenance expiry date.

# Send Files to BeyondTrust Technical Support

You can build and send file packages containing general information for support and collected events.

## **Create a Support Package**

Create a support package that can be used by Support. The package includes:

- All logs in the BeyondInsight Logs folder
- Storage size statistics on the BeyondInsight database
- · Certain database tables that contain information on scanner agents, and their jobs
- The debug\_syncit log file used to determine when files are updated from Auto Update

Note: Credentials are not stored in any of the package files.

To generate the package:

- 1. From Support Tools > Download Support Package, click Generate Support Package.
- 2. A ZIP file is automatically created and saved to the Downloads folder.
- 3. Email the ZIP file to your support representative.

# Send Analysis Files

Additionally, you can send events collected by Analyzer to provide additional troubleshooting details such as:

- · The number of errors collected in the BeyondInsight logs
- · Analysis of the events, including percentages of types (processed and purged)
- · The percentage of duplicate and timed out agents
- Analysis of BeyondTrust components
- Customer name

To generate analysis files:

From **Support Tools > Send Analysis to Support**, click **Send Analysis to Support**. This generates an analysis file and sends it to Support.

*Tip:* Analysis files are retained for 30 days. You can click a link on the *About* page to request that the data be deleted prior to the 30 day expiry.

BeyondTrust is not a chartered bank or trust company, or TC: 12/1/2022 depository institution. It is not authorized to accept deposits or trust accounts and is not licensed or regulated by any state or federal banking authority.

# **Download Updates**

BeyondInsight ships with BeyondTrust Updater.

Using the update tool, you can set up subscriptions to download product updates for BeyondInsight, Event Server, and BeyondTrust Updater.

# **Maintenance Information**

This panel displays the contract Maintenance Expiry Date for BeyondInsight.

If your maintenance is close to expiry or has expired, a warning banner displays at the top of the Dashboard. The toggle **Hide Maintenance Expiry Warning Banner** can be set to on or off, to enable or disable this warning.

**Note:** The **Maintenance Expiry Warning Banner** is only visible to administrators. Hiding the banner hides it from all administrators.
